And what is that?

I can turn this in your face as well. On Sept.9, the PlayStation ships and no
reason at all to select the Jagflop..

> BTW, Sinflop... Win95 production code is on its way. Win95 WILL ship
> August 24.

Apple's new low cost PCI PowerMacs went on sale on August 7, your point?

Apple had 20% gain in unit sales in the June quarter. Plus with the backlogs
to fill, 25% maybe to low..

I've said it before and I'll say it again:

Virtually all mailreaders have Killfiles or twit filters, so why don't we ALL start using them on the objectionable Mr. Sheppard?

Start a regular posting telling newcomers why this ranting idiot seems to post his lying vilifications unopposed, and advising them to twit the guy immediately.

If the whole newsgroup(s) ignores him, even Roger will _eventually_ get sick of whining into a vacuum.

The only time I've been bothered at all by this pratt for months is when you do him the favour of quoting him and boosting his hungry ego.

His blindness won't change. Apple is ranked #8 in computer manufacturers
right now, AFAIK that's the rank Atari had two years ago.

Some of then might sue and individal store named Big Blue Machines (not sure about machines, could have been computers or something) as IBM did -- you know, the "Big Blue" corporation you think is so holy.

Look, if you're going to have a trademark, it fairly *requires* you to protect its usage or risk seeing it used without protection at all (does

Kleenex ring a bell? How about bandaid? Or Scotch tape?)

It's not pretty, but it's law.

Well Sports fans, the game is over...Once again, Atari(the el-Tramiels) have fumbled the ball. It's fourth down and ten on the Atari ten yard line with 30 seconds left in the fourth quarter and Atari is behind by a mile. Software etc. has PlayStation signs posted and announcing the arrival of the PlayStation for $299 on September 9. Supposely there will be over 20 titles by arrival time..Atari can try their luck at the computer market again..I can see it happen.

Jag...console or religious cult...on the next edition of Geraldo!

Well, for once, I like your analogy....

But, let's extend your analogy one bit further, I believe in Miracles,
and, it does happen (ask Drew Bledsoe last year
against the Vikings, 2nd half, heh heh, or ask Joe
Montana). Sure, the Jag is down, but, it caught your attention, so, that
is pretty good! :)

In any case, I always root for the underdog (3DO, Saturn, Jag, Vectrex,
Intellivision, O^2, Neo Geo). Duh! :)

In Austria, we will see the official introduction of the playstation
without the Jag being officually released over here. Announcements on
the playstation were on TV and teletext, and the few companies who had
some Jags took them out of their programme, and Atari themselves cut
all treaties with their dealers, i.e., in Germany, the biggest
Atarimarket, there is *NO* Atari Corp.
Good luck to you over there in Canada

Heh heh heh... I can always look forward to getting a laugh out of
your posts, Sinflopper.

This fall could be very nice for Atari if they can get it right.
Ted Hoff, Atari's new Prez of North American Operations, seems to have
a good grip on the gaming market and Atari's position. Hopefully,
his efforts may culminate in some very interesting developments on
the Jaguar front. Keep your eyes peeled.

Oh, and Atari is going back into the computer business: computer
software, that is. Atarisoft will be releasing some games for the
IBM PC line this Christmas. If they get the games out in a timely
fashion, they'll probably sell large quantities, especially considering
the current state of the PC gaming market.

Now now, it's not the machine that sucks. The Jaguar would easily
dominate the market if it had the proper marketing to back it up. No,
what sucks here is the company. Atari, under the Tramiels, has been one
marketing blunder after another. I'd love to get a Jag but there's no way
I'm going to spend another cent on an Atari product until the Tramiels
stop using Atari Corp as their own personal tax shelter.

Personally, I can't wait for Atari to go bankrupt so that a real company
can purchase their assets and market their products effectively.

CRACKERS

> system and a game, plus the mem card and a second controller.

The 16 bit systems are still doing better than the Jagflop.. Were have you been? The higher priced 3do, Saturn and the PlayStation has clobbered the lower price Jagflop. The number one factor that makes/breaks a console is the quantity/quality of titles, something that the Jagflop lacks.

As your asertion that most people don't have $400 is false. Evidence, please?

> This is the exact reason that 3DO and Atari really made no market impact with

> the high-end platforms:
>

Utter bullsh t...Sega survived due to bringing out their 16 bit console before Nintendo did and as a result prospered at Nintendo's expense. There is no room for a console company such as Atari with a miniscule presence because titles will be ver slow in comming and quality suffers.

> Sony 40%
> Sega 30%

>The problem of your argument is that the Jewish keeper had the Bookshelf
>name much much longer than Microsoft ever did. That was an old store,
>you know.

That could be, but the law practically requires that a trademark holder such as MS level a complaint about it. The trademark in question may not have been registered by the bookstore or it may have only countywide protection -- either way or some other, MS had to "protect" that word as a trademark or risk losing it. I guess if it were IBM it would be okay, though, right?

>I can't believe you would defend Gates' ethics. Even programmers within
>Microsoft were taken aback by what their lawyers did.

Just as I can't believe you would defend IBM's ethics in going after Big Blue computers. (What was Gates' role in claiming the bookstore infringed on their trademark? Do you even know?) At the "risk" of offending lawyers who read this group, I'll say that I'm often shocked at what the hired mouthpieces do. But sometimes they must, from their perspective.

>Frankly, I have seen stores and PCs that had IBM-esque names, including
>and I wondered why IBM never sued them. Indelible Blue certainly sounds
>close too.

Sigh. Apparently, the trick in such a matter is to come up with a name that suggests the association you want without violating trademark. Besides, Indelible Blue had that name before they sold ostwo software, apparently. At any rate, their name is not used by IBM, as far as I know, to describe itself. (I'm sure there are many ex-IBMers on whom IBM left an "indelible blue" mark, however!)

>The next time, based on your logic, Microsoft should sue all those who
>manufacture those openings in our houses called windows. Maybe we should
>just call them all "Andersen Openings."

No, the thing protected must bear a similarity with what *you* have registered in order to protect it. Windows describes, as far as Andersen is concerned, an opening in a house; for Microsoft, it's an OS. As two distinctly different things, there not much chance I'll be asked what size opening I want to cover when I go into a software store and ask for "Windows" (unless, of course, the salesperson is trying to engage in a tired, old joke). I'm surprised you don't know this.

>What is legal may not exactly be right all the time.

Ain't that the truth! But it's legal. The only thing we can do is try to change the law through elected officials, and I don't see much hope in that.

2499. Lottery Companion 2 program available

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-14 00:00:00 UTC
From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <738209313wnr@dwell.demon.co.uk>
Source record: 11554

Following on from Lottery Companion 1 which achieved 60% in ST Format, Lottery Companion 2 is now available.

The program is arguably the most powerful and comprehensive National Lottery Program available for the Atari range of computers, and even runs on the Falcon.

Complete UK statistics including Ball Set, Draw Machine, Draw Order and Date of Draw are included.

It uses a friendly combination of Windows, Drop-down menu's and Resource fields and buttons on top of a powerful number generation and statistical engine.

Random, Manual, Range, Hot, Cold, and Wheel with 0 to 5 Bankers can be used to select over 7000 number sets per file. you can have as data files as you like with personal or syndicate number sets.

The program is Shareware with Registration and six months Support from as little as five pounds.

But why not look for yourself? - Message a request for a copy of the program personally to me, and I'll be happy to mail it back in UUE format.

Alternatively send a Disc and S.A.E. to LC2, 8 Brookside, LE10 2TL.

Note: This is not a ruse to add your name to a mailing list, I am an independent Shareware author who has been writing for the Atari 16/32 bit range since 1988. I will only contact you again if invited to do so.

It's great to see such a thriving Atari community of the NET, and I look forward to becoming involved in the many On-Line discussions.

I hope to hear from you soon.

>been? The higher priced 3do, Saturn and the PlayStation has clobbered the
>lower price Jagflop. The number one factor that makes/breaks a console is the
>quantity/quality of titles, something that the Jagflop lacks.

Wrong, as usual. Games aren't the only thing. Price and retailing
presence is a huge factor as well. Atari lacks on the retail and
distribution front; which is why their sales are lower than the
competition, which has the retail presence. Put all of them on equal
distribution/retailing/marketing, and the lower priced Jaguar, despite
having fewer titles, would probably sell the best.

>As your asertion that most people don't have $400 is false. Evidence, please?
Evidence? The CD-i and CDTV. Both failed. Nolan Bushnell said that a
game machine at $400 will not succeed (at least beyond niche).

As for the current consoles, it's too early to tell, but none of them are
doing extremely well in the marketplace.

>Quit being a Jaguarownersindenial(TM by WillBill)...You are being overly
> optomistic
>in Atari's 15% share. You have no clue in people's buying habbits.

Idiot! you have no clue, period! Let's look at the numbers, shall we?
Since you live in North America, we'll use that as a market base.

3DO has sold 700,000 systems of which >400,000 are in Japan. Let's say,
then, that 3DO has 300,000 installed base in North America.

Estimates of Jaguar sales are currently around 250,000 or so, the majority
in North America, say 200,000.

As for the PlayStation and Saturn North America sales, probably about 100,000, and I'm being generous here.

3DO: 300,000
Jaguar: 200,000
Others?: 100,000

Total: 600,000

Jaguar's share is then approximated at 33% of the next-generation market in North America. What was that about not even having 15%? See how dumb you are? You see only what you want to see, and that's why your entire sense of logic is a heap of out-of-the-butt gibberish.

: The 16 bit systems are still doing better than the Jagflop.. Were have you
: been? The higher priced 3do, Saturn and the PlayStation has clobbered the
: lower price Jagflop.

The PSX isn't out yet. The Saturn hasn't outsold the Jag in any
place except Japan. And as for the 3DO, a recent press release pointed
out that there are only about 250K consoles in the US. Hardly what I'd
call clobering.

The number one factor that makes/breaks a console is the
: quantity/quality of titles, something that the Jagflop lacks.

Yes, though you will never be satisfied. If 100 titles appear on
the Jag, you'll complain that there's less than 150.

Oh, I see...Just next - gen market. I the entire market is included, Atari's
market would be 1%...

It's like me saying that Apple has 80% of the publishing market and 60% of the
education. But overall marketshare is 9%.....

Like it or not Atari is competing with the 16 bits as well...

It was 150,000 as of January '95, get over it(tm)...

|> >
|> > As for the PlayStation and Saturn North America sales, probably about
|> > 100,000, and I'm being generous here.
|> >
|> Come Sept.9, will be 5 times as much...

Lessee, in its first two months of existence, the Saturn sold 20,000
units (Sega's own figures, pesky thing these facts), so given 3 months
of sales, and the Christmas rush, let's liberally multiply that figure by
4 and it's still under 100,000 units for the (costs almost as much as
a Saturn to play anything besides Greyworld) PSX... Expensive systems
just don't sell. Neo Geo found that one out the hard way... The only
mistake to be made here is to assume that just because the PSX and Saturn
may not sell well, the jaguar will. I predict Nintendo winning again
this Xmas with their "Who needs a new system?" marketing campaign...
Never mind they're releasing two of their own in the next 8 months...

And Petey, just wait 'til the feminists get a load of that PSX TohShinden
TV ad... I'll let you discover this gem for yourself... Sounds like
they removed the clue bus stop from the front of Sony Computer
Entertainment's main office...

|> > 3DO: 300,000

|> Oh, I see...Just next - gen market. I the entire market is included, Atari's
|> market would be 1%...

I'd be >SHOCKED< if the jag hasn't topped 200,000 by now, given the 7,000,000
in net (not gross, look it up) sales for January 1st to June 30th (latest
ATC stock report), by this figure, they have sold up to 150,000 jags since
then. But since they aren't tooting their own horn for doubling their market
size, I'm happy to scale that back by a factor of 3 for a worst case scenario
of 50,000 units since January...

|> It's like me saying that Apple has 80% of the publishing market and 60% of the
|> education. But overall marketshare is 9%.....

8%, get your facts right... Apple and Atari have a lot in common. They
both love lawsuits, they're both doing rather poorly next to the competition,
but Atari's strength is hardware while its weakness is software and the
exact opposite is true of Apple...

|> Like it or not Atari is competing with the 16 bits as well...

The only thing that amazes me about Atari is how many opportunities the big
guys throw at them with their awe-inspiring stupidity, only to have
them countered by an equally stupid lack of response from Atari...

You fool! (*slap*) That is how they will DRAW ATTENTION to their product.
Whenever someone has a boycott or protest, it ATTRACTS more attention
to a mediocre product, and it helps boost sales.

Same thing happened to Last Temptation of Christ.

>8%, get your facts right... Apple and Atari have a lot in common. They
>both love lawsuits, they're both doing rather poorly next to the competition,

I would argue Apple like Atari makes great hardware but LOUSY software.
System 7 features...

1) Non-responsive task switching (Co-operative)
2) No Paged memory management (wastes tons o memory)
3) Crashes Galore

PR Newswire

August 14, 1995, Monday

SECTION: Financial News

DISTRIBUTION: TO BUSINESS EDITOR

LENGTH: 555 words

HEADLINE: ATARI CORPORATION ANNOUNCES SECOND QUARTER 1995 RESULTS

BODY:
Atari Corporation (AMEX: ATC) today reported its financial results for the
second quarter ended June 30, 1995.

Net Sales for the second quarter of 1995 were $3.0 million, as compared to
the sales for the second quarter of 1994 of $8.2 million. As a result of the low
sales volume, the company incurred a Net Loss of $4.0 million for the second
quarter 1995 as compared to a Net Loss of $3.4 million for the same period of

PR Newswire, August 14, 1995

SUNNYVALE, Calif., Aug. 14

Commenting on the report, Sam Tramiel, Chief Executive Officer said, "The
results were as expected, as the industry is currently going through a
transition from older 16-bit systems to higher-technology 32-bit and 64-bit
system. We believe the Jaguar is competitively priced and well-positioned to
take advantage of this transition."

Commenting on marketing and sales, Ted Hoff, President of Northern American
Operations, said, "Our focus is on creating compelling software for Jaguar and
in July we commenced shipment of 'Super Burnout' and 'White Men Can't Jump.'
Additionally, third party developers shipped 'Flashback' and 'Pinball
Fantasies.' During August, Atari will ship 'FlipOut!' and 'Ultra Vortek,' and we
will commence shipments of the Jaguar CD Player for a retail price of $149.95.
The Jaguar CD Player will include two free games, 'Blue Lightning,' 'Vid Grid,'
and a demo version of 'Myst,' plus an audio CD of the soundtrack from the
hit Jaguar game 'Tempest 2000.' In September, Atari will be
increasing distribution in the mass marketing channels and will launch a
dynamic marketing campaign.'

Atari Corporation has been in the video game business for over twenty entertainment system. Atari Corporation is based in Sunnyvale, California.

And this surprises you? I've been expecting this since Saturn's price
was announced to be $399. The system isn't selling very well at all.
These companies haven't been paying attention to the past record of
expensive CDROM consoles in North America.

>Well, the Saturn and the PlayStation has done well in Japan with more than a
>million units sold each at that price.

What sales figures are you using? Sony's? Big mistake.

> Here in the U.S. the magic price is
>below $300.

And the Saturn is $400 and the PlayStation will be $350 (with pack-in).
So what does that tell you? It tells me, after the initial sales
surge, there won't be much else happening at that price.

>> Jaguar's share is then approximated at 33% of the next-generation market
>> in North America. What was that about not even having 15%? See how dumb

>Oh, I see...Just next - gen market. I the entire market is included, Atari's
>market would be 1%...

Your ignorance astounds me... if we factored in the 16-bit market, the
next-gen sales base combined probably stands at less than 5% TOTAL.
None of the next-gen systems are doing well right now. The CDROM consoles
are too pricey. The Jaguar lacks the software and distribution. What
does that leave you with? NOTHING. Which is why no system is doing well
right now.

Hey you get the MAG? cool.... I think you should mail the editor with what is happening in NZ from time to time (you can do it through me if you like hehehe), he is always looking for stuff to put in the MAG...

MACE at the moment is going thru a bit of a transition at the moment, It is about to go RATSOFT on the BBS (Michtron has seen better days), we have a new president, and a couple of us "net" animals are gradually converting the masses to get on to the net. Things are reasonably healthy here in Oz Atari-wise, regardless of the rubbish that comes out of R.S's (hmmmm..... R S now what could that stand for?) mouth.

Cya.

:You have not looked hard enough. I purchased a New Mac 630 with cdrom for
:$999. Apple is in not in any heap of trouble. Apple needs to get their
:manufacturing act together and eliminate the backlogs.. I have access to
^^
:plenty of software with lots of choices. Many of us buy from the catalogs due
:to low price and convenience.

For once, Sinclap has said something sensible. Apple DOES have to do
something about its huge backlog. For those who are unfamiliar with
this, incompetent Apple management grossly underestimated the demand
for Power Macs and therefore didn't add the necessary maunfacturing
capacity or order enough Mac parts. The result: a $2M backlog! I
guess Mr. Tramiel does have a monopoly on incompetence after all!

BTW, Sinclap, is Apple DOING anything to correct this problem, like
building a new factory or contracting out some Mac production or
redesigning the Mac so it uses less of those hard-to-get custom-
made chips? Or are they sitting on their fat asses and doing nothing?
Inquiring minds want to know.

Oh yea...The incompetent Apple management who are able to grow the company by
over a billion in sales annual with hundreds of millions in profits with a cash
reserve of two billion...Yep, Apple has incompetent management alright!!

>
> BTW, Sinclap, is Apple DOING anything to correct this problem, like

> Inquiring minds want to know.

Apple will assemble 25% more product for the September period and 50% more for
the December period from the year before.

As for Apple sitting on their asses. I attended an Apple technology seminar
today for the UNI staff. Apple showcased their newest PCI Macs and software
technology such as Quicktime VR. Quicktime VR are one of the many products
that will keep Apple in the game. I was able to use VR on the 9500, very cool.
Apple sold quite a few Macs today and with the new bundle prices, sales have
spurted..

Silicon Graphics and Sun have small marketshare.. Both very profitable and fill
a valuable niche...

Apple's share is small in the overall, but unit sales will be in the 4-5
million this fiscal year...

No problem...

Atari invented the Joystick - Virtually all switch operated joysticks will
work with your computer - There has been no change since the 400 days.

If it fit's then it will most likely work.

Your local store should be able to offer a very large choice.

Amstrad did mess around with the wiring in the bad old days in an effort to
force users to buy their joysticks only.

Also the Atari 'mark 2' joystick - Square knob - screws up the ST for some
reason.

Hope that helps.

2532. Dan Dorfman is owed an apology!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-20 00:00:00 UTC
From: sinclap2954@cobra.uni.edu
Message-ID: <1995Aug20.173916.47805@cobra.uni.edu>
Source record: 11489
Cross-posted to: comp.sys.atari.advocacy,rec.games.video.atari

Dan Dorfman predicted the collapse of Atari's stock price and that the Jagflop would fail to catch on in the console market. His predicitions which were a no brainer have come true.

Jagflop advocates flamed Dorfman stating he was wrong and had a vendetta against Atari. Well, sportsfans the Jagflop has failed...

An apology is in order..

Jag..console or sex cult?...on the next edition of Jenny Jones!

: Give MacWareHouse a call. I am sure they will send you a nice glossed catalog
: every month. Apple Canada has announced that sales have exceeded a million
: units..

Oooh ahh. Do you have any idea how many PC's are sold in Canada
each year? That base of Macs is pathetic compared to INTEL machines.

: News to me..

It's hard to be alone isn't it.

: To send the message home to the Jaguarindenial(TM-WillBILL) who thinks Atari
: can come from behind..This is fun..

There aren't too many people who think that way Peter. The Jag is
a good machine at a good price. Many people who bought it have enjoyed
other Atari products and find that the Jag is handled much better than
previous machines. No, it isn't going to dominate anything or ever take
over. On the other hand, nothing has sold very well since the SNES and
Genesis.

Gheeze, Peter! You know, you were still annoying, but you were acting almost human for awhie there. Guess a weasel can only dress up like a person for so long before someone notices that they can't walk in high heels - or something like that. At any rate, what I'm trying to say is - I don't like you very much. Neither does anyone else, I'd wager. Why? Because you are a mean-spirited dork who takes pleasure in the (imagined) misfortune of others.

Welcome to my killfile.

: Jagflop advocates flamed Dorfman stating he was wrong and had a vendetta
: against Atari. Well, sportsfans the Jagflop has failed...

And what has succeeded? The Jaguar has sold around 200,000
consoles in the US according to the latest edge. The 3DO just reported
that it now has a worldwide base of 700,000 machines ... with about
450,000 to 500,000 being in Japan. That leave 200,000 or so consoles in
the US. The 32X sold about 200,000 in the US. Translation ... nothing has
succeeded by your standards.

: An apology is in order..

Yes ... when are you going to appologize to the people who pay
for their net access by filling your crap in the inappropriate
newsgroups? How about an "I'm sorry!" from you, Sinflop?

2540. Release of OASIS 1.30E

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-21 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <809037272_OASIS_@yeadontt.demon.co.uk>
Source record: 11495

As of Monday 21/8/95 OASIS 1.30E has been uploaded to the Demon and Hensa
FTP sites.

Two files have been uploaded.

OASIS130.TOS is a complete version of OASIS for people who have either
never installed OASIS before or who have a version of OASIS below 1.20E.

UPD_130.TOS is the files that have changed from version 1.20E for those
who have already installed 1.20E.

I'm wondering if Atari has anything special planned for this fall... like
a nationwide ad campaign or something like that...

Last i heard was that they hired a new PR firm... would now be a good
time to buy atari stock?

That requires more maturity and humility and admission of wrongdoing than Peter will ever muster in this lifetime.

: > the US. The 32X sold about 200,000 in the US. Translation ... nothing has
: > succeeded by your standards.

: The issue is Atari and Dorfman..As usual you dance around it..

I danced around it? You said the Jagflop has failed. I threw in
some figures to show that in the grand scheme of things, *NONE* of the
new systems have succeeded. Now who is dancing? You said Dorfman is owed
an appology for all the bashing he took because he was right about the
Jagflop failing. Look at the sales of all the new systems Peter. Nothing
is doing well.

: Inappropriate newsgroups?

rec.games.video.atari is for discussing Jaguar news, not for
attacking the product and annoying the users. People who read that group
want news, not your pestering. I believe that has been posted many times
already. comp.sys.atari.advocacy and rec.games.video.advocacy are the
places to voice your opinions (positive or negative) about any system or
product. A lot of people pay for their net access and don't want to read
your garbage in groups where it doesn't belong.

: You mean they will have TWO advertisements?

Considering they ran upwards of eight print ads in each magazine
last Christmas and aired five or six different commercials, it's obvious
you aren't watching carefully.

Many toy stores, such as Toys 'R' Us, still carry these joysticks.
They are the same ones used on the Atari 2600 units.

Hey, Sindope! How do you like the Win95 rollout!!! Thousands of
people waiting in line at midnight for stores to open at special times
to sell Win95, the Empire State Building to be lit up in Win95 logos
at night, security guards guarding stacks of Win95 packages, Jay Leno
doing a special promotion with Emporer Gates... the list goes on and
on.

Yep, it's pretty pathetic, the Microsoft monopoly has gotten too big.
But, it puts things in perspective for puny Apple, doesn't it?

The amount of games available for the mac is increasing rabidly. Lucas
Arts has started porting there line up of games. You can already get
Rebel Assault and Dark Forces for the mac. And the mac version has
twice the resolution as the PC version while the PowerMac version has
four times the resolution. DoomII is available for the mac. So is
Super Wing Commander and Wing Commander III is on the way. Plus there
are games like Marathon II and F/A-18 hornet that have no PC equivalents.

IBM is good for playing games but thats it stick with an apple or
better yet an Atari. More easy to use with better built programs
that utilize the computer. Unlike IBM who ever builds up a program
waste so much of its memory. The Jag will be strong if people don't give
up.zz

I have..The PlayStation and the Saturn have done well in the Pacific rim when released with sales of over a million piece. 3do sales have improved lately. The PlayStation will do very well in this side of the Atlantic and Pacific.

Atari's sales in the most recent period collapse...sales down by over 50%...Atari's world wide sales of the Jagflop range from 150,000-200,000(thats being generous)...Deal with it..

2560. **** Ch.A.O.S. ****

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-26 00:00:00 UTC
From: Jeffrey Wood <woodzy@delphi.com>
Message-ID: <RvJBbZ7.woodzy@delphi.com>
Source record: 11515

Hi, and welcome to Ch.A.O.S. Country. Welcome to the revolution. The Cheyenne Area Orphaned Systems, or Ch.A.O.S., is a club devoted solely for the preservation of classic non-IBM systems, such as ours, and for the defeat of Microsoft. If we wanted IB
M compatability, we would have abandoned our systems long ago. Those of us who do have IBMs, but still use our classics, only bought them out of necessity, such as for work or school.��This is not a political organization. We do not hold any specific r
ight wing or left wing political views. We do believe in fair competition and Microsoft is NOT fair. We spent all that time and money on our respective systems because the performed the task or tasks we bought them for. Wether it be for gaming, educat
ion, office, or whatever, our classic systems performed upto our expectations, and in some cases, beyond the original design. Why should we abandoned everything we put into our systems?��I have been working on the designs of two programs that I feel wou
ld unite all of our systems, yet retain the sovereignty or flavor of each individual system:��1. A terminal shell with game maker to allow two or more non-compatable systems to play games over the modem or in a mini-network. Of course, standard protoco
ls will have to be set between computers to ensure game play. But, graphics between two different systems wont have to be the same because screen data wont be sent, just tiny info packets. The games would take full advantage of the graphics and sound c
apabilities of each individual system. The games would be played as close to real time as possible.��2. A DEVICE OPERATING SYSTEM (DOS) desgined on a bi-level format: The primary level is a whole new computer that provides cross-platform compatability
between our classic systems. The computer will be based on the PowerPC. This will allow each classic system to be enhanced to that of at least a 486. Without losing much compatability with the existing sytems. Full compatability is not guaranteed be
cause of the new enhancements to each individual operating system. But, at least you wont have to abandon your whole classic system! The secondary level is a whole new disk operating system for the original classic. This will allow direct disk access
communication between ALL systems. Yes, even IBM. Just imagine, a C64 computer operating system with 38k free RAM, can now have as much as 3.75 Meg free RAM on a 4 Meg System! This is directly accessable without bankswitching or even use as a RAMDISK!
Just imagine the fresh, new applications that can be developed that retained the original C64s flavor. No, this is not limited to the C64, but to all classic systems, such as the Atari, Tandy CoCo, VIC20 (YES!), Apple, etc.��All of our classic systems
have their own uniqueness, their own distinctiveness. That is why we refused to follow the industry or marketing trends. This would allow us to preserve our systems and at the same time develop a cross-platform industry standard. Who says we have to
follow the Microsoft standard? Lets follow a standard, sure, but we should also be allowed to keep our systems we have devoted so much time and energy into!���Cheyenne Area Orphaned Systems�c/o Jeffrey Wood�813 Covered Wagon Drive�Cheyenne, Wyoming 820

Ah, Mr. Moron again, who admitted to own an Atari 800 rip-off system
already. Now, Atari has been "somewhat" more popular in the late 70s.
And they definitely had more than one ad.

: you want to enter.

Just to say, advertising in video game magazines in the case of Atari is
inane and virtually useless. They already blew the introduction of the
Jaguar; certainly it's not going to make a big splash in magazines which
have ads and reviews of superior games of the Saturn and Playstation,
games which actually are progressively faster/more colorful/more
everything than anything done before.

Atari probably would do well advertising in magazines a la Newsweek,
Time, etc... perhaps they can trick people now in their late 20s/30's
into thinking that Atari is still a power in the gaming industry.

Atari is in a bit of trouble right now... they need a product that
sells... or go into another business... or go out of business.

2569. Windows 95 & PCs

Newsgroup: comp.sys.atari.advocacy
Date: 1995-08-27 00:00:00 UTC
From: kwd9152@is2.nyu.edu
Message-ID: <41pb8s$h3u@cmcl2.NYU.EDU>
Source record: 11524

One of the funniest things I've been hearing in TV reviews/reports on Windows '95 is that the improvements will allow better and faster gameplay (It focused on a demo of the reasonably new Pitfall game). Hahahaha. :)

You know, Pentiums and the faster PC processors pack quite a lot of power... but it's funny that the mainstream use is for games now. A word processor/spreadsheet could run very well on a 386. Therein lies the problem: Isn't high end productivity software supposed to be the reason for processor-chip advancement... not gaming?

Some babble:

The hot OS for hackers and computer junkies is LINUX right now... hmm, I heard that running the 286 version on a 486-based machine gets great performance...

Right now, I'm running on a PowerMac 6100/66, and I'm having a pretty good time; everything is fine and dandy; Ethernet is wonderful... and I guess the primary use of my computer is as a user intuitive interface to the internet. I really don't have time to really dig into RPG's and simulators. Funny, but the Mac actually suits my needs more than an Atari would; I never thought I'd think the MacOS would be better than Atari's... but it is much more flexible. It takes a little while to get used to pulldown menus, but now I find it annoying on my ST when the mouse accidentally gets pushed to the menu bar(and everything stops!). Also... Remember how UIS was supposed to be the greatest file selector on the planet? Well... if you had access to the desktop and could run multiple programs at once, well... the selector doesn't need to have every file command possible. :)

Of course, the MacOS still has some annoying features---the use of the trash can, for EJECTING disks, for instance---however, I rarely use floppies, so this isn't much of a problem. Aha! Huge hard drives... something TOS couldn't really handle. :) Hmm, that's about it...err...hmm, funny, I kind of wish there was some way to access a CLI sometimes. :)

The Falcon is good for... Digital Audio. I suppose Cubase Audio is the sole reason for Atari's remaining presence in the computer industry... a specialist's tool.

So... here's the deal:

If you're looking for an inexpensive digital audio solution, you might want to consider a Falcon 030...

If you're looking for a nice highly compatible(and progressive) platform, you might want to look into PCs w/ Windows/DOS/Warp--- keeping in mind that _headaches_ are bound to occur as a result of working with the machine. Ah, but you get great games. :)

If you're an internet junkie, the Mac is a great platform, with its nicely proven and integrated TCP/IP... plus the newer models w/ PowerPC chips offer the potential future of something better in store(as an aside, there are few if any "incompatibility" problems associated w/ the new chips anymore, if at all. Plus... w/ the addition of a new program called Speed Doubler, older programs now run 4x faster than they do now). If you want to browse the WWW, make home pages, do some medium graphics work, video conferencing... this format is the easiest way to do it.

Alternatively, for the underground comp user, LINUX(unix) is the way to go. Make a linux box... and deal with it.

Peace.

Now here is a GREAT idea for Atari! (although I don't agree with
your explanation). When people are over and see my Jag, they say
"Wow, I didn't know Atari still made video games! That's way
better than Nintendo/SNES/Genny/etc! Why haven't I heard of this!"

A few adds in mainsteam adult press might do WONDERS for jag sales!

(IMHO)

There are more people outside of the 12-20 bracket than in it.
I'm 30 and would/did buy a Jaguar primarily for Defender 2000.
My business partner went wild over Tempest 2000. (He's 32)
My wife would be keen on the whole deal if the Jag had
solitaire or at least ONE kid's game for our 1 yr. old.

Anyway, the point I'm trying to make is that if you only
market to a small subset of the buying public, then of course
that's where the #'s are. Simply playing the Defender/Tempest
"nostalgia" card with the 30 somethin's would be a big payoff for
Atari. (IMHO)

In fact (digression I know) I belive the PC will eclipse all consoles
in the not TOO distant future. This is because you can get games/SW
that pleases everyone in the house - not just the teen boys. This is
IF someone can get the PC hooked into the family TV easily and cheaply.

> you aren't watching carefully.

Atari only advertises in gaming related magazines, considering that they receive the best value for the ad money they spend. That gets the word out to people who already own a gaming system, but does nothing to reach the rest of the buying public.

Also, television advertising is done on a regional basis (Atari still does not market the Jaguar on a national basis), so while there are regions which see lots of Atari ads, there are also MANY areas which have seen few, if any, Jaguar ads.

Simply because someone hasn't seen Jaguar ads doesn't mean they're not watching for them.

> If you want to advertise video game products in print media, why not do it
> in magazines that deal specifically with the market you want to enter.

Because with a few exceptions (notably those who have no game system now,
and are reading the magazines for help in making a choice), most people
who read gaming specific magazines ALREADY OWN a video game system, and
chances are, it's NOT an Atari Jaguar.

Advertising in that market means that Atari has to try to convert owners
of competing systems to theirs... which means abandoning not only the
competing video game system, but any software collection and peripherials
the owner has collected. Not an easy job, especially with a weak product
line.

Atari, Inc. (the Warner Communications company) used to advertise in a much
wider range of print media, which reached potential owners who might not
have decided on a particular system, or indeed might not have even ever
considered buying the product at all.

Atari Corp, during its computer days used to advertise only in Atari specific
magazines.. "preaching to the choir", so to speak.. that is, about the
only people likely to see the few ads they ran were people who already
owned their product. No one I know ever figured out what the logic of
that was supposed to be.

Obviously with a limited advertising budget, Atari feels that ads in the
gaming magazines will bring them the best exposure for the ads they can
afford to run... I hope they're right.

: Atari only advertises in gaming related magazines, considering that they
: receive the best value for the ad money they spend.

Not quite true. I've seen Jag commercials on TV and I've seen an
ad in one of the boston newspapers. True, Atari could do more TV
advertising, but the presence of the Jag on TV is *MUCH* stronger than
the ST, Lynx, 7800, XE presence ever was.

: Also, television advertising is done on a regional basis (Atari still does
: not market the Jaguar on a national basis),

Eh? I've seen a few commercials on network television.

Okay Peter ...

==========

Now we know the facts, as listed in the following article. And if 450,000 of these were in Japan, that leaves only 250,000 sales in the US.

3DO SAYS SALES 700,00
By Susan Moran

PALO ALTO, Calif. (Reuter) - 3DO Co president and chief executive Trip Hawkins said about 700,000 units of the company's CD-based game machine have sold worldwide, up from roughly 500,000 a few months ago.

And the Multiplayer system is now sold in more than 10,000 retail stores in the United States, up from less than 4,000 a year ago, Hawkins said. ``We've got a pretty healthy installed base,'' he said in an interview.

But 3DO's bottom line looks far less healthy. Earlier today, the company reported a loss of $7.9 million or $0.32 a share, for its fiscal first quarter ended June 30.

That is a slimmer loss than the $16.1 million, or $0.78 a share, 3DO lost in the year-ago quarter. And it's modestly better than the Wall Street consensus estimate of minus $0.37 per share, according to Zack's Investment Research. Analysts' forecasts ranged from minus $0.78 to minus $0.17.

Founded in 1991, 3DO has yet to turn a profit. Hawkins declined to project when the company might do so. ``There's no timetable that I would discuss publicly.''

Analysts have generally expected 3DO to become profitable sometime during the fiscal year ending March 1997.

Nintendo Co Ltd, which along with Sega rules the video-game player market, plans to introduce next April its next-generation Ultra64 system in the United States.

3DO has cut the price of its system to stay competitive. The first version, made by Matsushita Electric Industrial Co Ltd under its Panasonic brand name rolled out in October 1993 for a hefty $699, reflecting a business model Hawkins himself has conceded was misguided.

Hawkins said that with the $16.6 million 3DO raised in equity during
the June quarter, ``our cash needs are probably met right now for the
forseeable future.''

Err... Sure. How much would you like? I'm up for $20.

: > It's also the slowest time of the year.
: >

: Oh, please...Not for other firms..

Well, Sega and Nintendo sales are down 70% from this time LAST year.
Over all, these are from teh second quarter sales, which are always teh
worst of any period (10% of the annual sales)

: Industry analysts and Atari's poor performance....How many consoles and games
: did Atari sell on two million in reveunes in the last period?

Industry analysts? Where did you did up that 200K Jag worldwide?
Hmm... The only industry analysts I've seen report are that Sony
inflated teh number of Playstations sale by 100% (claimed doubled of what
they had even made) and that Sega claimed a whopping 170% more Saturns
were sold than manufactured..

But regardless, the Jag has outsold the Saturn and Playstation in North
America... ut this could change (well, the Jag probably will alwys
outsell the Saturn)

: Even Scot Legrand is comming to the dark side of things..I suspect a
: PlayStation will be in his Christmas stocking.

I would like one too, but at $300US it is just a tad pricey for the games
coming out for it. Maybe next year I'll look at getting one.

But if you want to give me one for X-mas, I'll gladly accept.

: have seen ads from other console firms in the mags that I read..

Most of the video game buying public is made of teenagers. How
many teens do you know that read Time and Newsweek? You are right though
... Atari should advertise in other mags that aren't video game related
that would be frequented by teens. Rolling Stone and others would be a
good start.

God, I'm embarrased to say I agree with Sinclair. From what I've read articles are still saying Windoze is <<almost>> as easy to use as a Mac. One of my fellow employess lost his liking for it (win'95) after it screwed up his hard drive and he had to re-partition it 300MB down the drain. And yes, he knows how to run a computer he's our network administrator.

Actually, though there is no real point to this thread, only the original
PowerMacs used IBM 601 chips. Motorolla now manufactures the 601 used
in all currently shipping PowerMacs.

I found this in soc.culture.french

To all,

For those who do not know who McAfee is -- it is a company that write
anit-virus programs.

McAfee-Question : Is Windows a virus ?
No, Windows is not a virus. Here's what viruses do:

1. They replicate quickly - okay, Windows does that.

2. Viruses use up valuable system resources, slowing down the system
as they do so - okay, Windows does that.

3. Viruses will, from time to time, trash your hard disk - okay,
Windows does that too.

4. Viruses are usually carried, unknown to the user, along with
valuable programs and systems. Sigh... Windows does that, too.

5. Viruses will occasionally make the user suspect their system is too
slow (see 2) and the user will buy new hardware. Yup, that's with
Windows, too.

Until now it seems Windows is a virus but there are fundamental
differences:Viruses are well supported by their authors, are running on
most systems, their program code is fast, compact and efficient and
they
tend to become more sophisticated as they mature.
So Windows is not a virus.

It's a bug. !!!

VME vga card for ATARI MEGA STE???
How am I gonna do that, I allready have a card but it is ISA, are there other ways to fit it into my computer? And what about the software? NVDI et4000 or some shareware? Or is it really necessary that I buy the VME card and NVDI et4000 from ACN in Holland? That would be than about $300... a little expensive, than I'll better wait for the mighty ATARI MICROBOX wich has the best specifications I have ever seen!!!
And my memory, can I put normal 30 pins simms into the sockets or do I need to by simms "specialy" made for that computer. For the moment I have simms 4x1MB but I want to change them with 2x4MB can I just do that?

Apple's 1995 sales are expected at about $11 billion and $500 million in profit. I guess that doesn't count...Did you see the new Powerbooks announced yesterday? Apple's continous product release in the last three months and Atari can't deliver a measly cdrom unit..

Apple UK announced a new PowerMac 5300 % 6300(100 mhz 603e)..North America may have it someday...

: So, the Jag is an IBM, the Apple is an IBM. About the only thing IBM
: dosen't make well is "IBM's" ;)

Nope, sorry. The PPC chips are manufactured by Motorola under a joint license by IBM and Apple. The architechture (basic idea) of the PPC RISC chip is an IBM design. However, the completed implementation was a project of Motorola and Apple.

Basically it went like this:

APPLE: "Check this out! IBM research has designed this nifty RISC CPU architechture. Let's use it. Hey, we use Motorola chips in our existing designs. Why not ask them to build something for us based on this?"

APPLE to MOTOROLA: "We have this neat idea for a new computer, but we need you to help us build it. Are you interested?"

MOTOROLA: "Are you kidding??! YES, when do we start."........

IBM licensed the basic design to Motorola. Apple has the notoriety of thinking up the idea for a complete computer. Motorola has the distinction of building and expanding upon IBM's design. However, the actual chip layouts and core design are all Motorola's. Motorola uses the IBM based technology in ther PPC chips AND their 68060 chips. IBM merely collects royalties on the concept implementation.

As to the Jaguar. Atari designed it, prototyped it, and IBM manufactures it via Atari's specifications and design. It is not an IBM design, it's an Atari design.

Rich

Kevin,
My Falcon can deal with large hard drives. SCSI-II port.
I also have multitasking (MultiTOS and Mag!x for _preemptive_
and Geneva for cooperative). I still think UIS looks nice :-).
I will admit that you have a great machine for networking. I
wouldn't mind a Mac for that reason alone. However, software
for the Atari will come out. It is only a matter of time.
As far as the OSs what exactly can you do on the Mac that you
can't on a newer version of TOS (2.06 and above)? I am
curious.
The problem I have with Macs is that they look like they may end
up like Ataris- great machines that should have made it but just
didn't. It is hard to compete with clones and Microsoft. But
maybe a PowerMac is in my future (with MagixMac, of course).

Atari's sales collapse from the same quarter a year ago. The Jagflop lost any momentum(if it had any).

Who's fault is that? I can't find one..The point is that it is not how good the Jagflop could of have been, but how Atari handled it is the issue.

ST Replay *was* Microdeal's 8 bit sound sampling and playback cartridge that, predictably enough, plugged into the ST's cartridge port. Their was also a 16 bit version (Replay 16), and a stereo version (Stereo Replay).

Microdeal released their Stereo Replay editing software into the public domain, ooooh, months ago. I seem to recollect (do correct me if I'm wrong) that they went down the swannee shortly thereafter.

Excuse me? Which 32 meg partition limit? I've got an M4STe with TOS 2.06 and have one single 345 Meg partition (SCSI). Are you sure you're not thinking of M$-DO$?

>: I will admit that you have a great machine for networking. I
>: wouldn't mind a Mac for that reason alone. However, software

>Hahahaha. :) It's only a matter of time? :) I got tired of waiting. :)

Duh... I do believe there is a little thing called MiNTnet, which supports the BSD socket implementation, and there are also even different network cards for Atari computers? Heck, there's even a version of Lynx compiled for MiNTnet, and if you don't like MiNTnet, you can always run Linux on the TT or better.

>Still, the only thing really going for the Falcon right now is Cubase
>Audio. Come on, you can't even run 28.8k modems on these machines w/o OS
>patches. :)

Oh? Strange. I am so certain that I had hooked my M4STe to my friend's Falcon on some 131kbit, and we did a little experiment on a half meg line between'em. Try CoNnect. Damn good modem program. ;^)

>allocated to programs... the recoverable trash can's built in... long

"built in" is a very relative expression. AFAIK, 95% (percentage is a guess and I do by no means claim it to be accurate) of the MacOS is on the harddisk.

>file names are actually nice---much more valuable than I ever thought they

That's a filesystem problem, not an operatingsystem problem. With MiNT, you can do just about any filesystem you please. In fact, running MiNT with a Minix partition is recommended. And yes, I do like '/' a lot better than ':' to seperate directories, but then again, that might just be me being too used to UNIX.

>would be when I was using the ST and PCs... also, you can place files
>right on the desktop...as well as set up aliases for files wherever.

I don't have any problems putting files and program right on the desktop. As for linking files, that is again a filesystem problem and not an operatingsystem problem. If you run a Minix partition, you should have no

problems linking files. Doing it on a DOS partition will not work, simply because the DOS filesystem specification does not support linking of files.

>I guess a big reason why the MacOS seems a bit better than TOS is that
>many of the basic features require a lot of auto folder programs via TOS
>to make things more even. -- yes, I realize a lot of the things I
>mentioned really are possible on the ST, but things aren't quite as
>intuitive.

Where did I hear that before? Oh yea! My brother. Well, who said the ST was a machine for end-users? I like to see the ST/TT/Falcon as professional computers for people who know what they are doing, and Macs as end-user computers for people who knows nothing about how a computer works and has no plans whatsoever to learn about them.

>Fine, there might be less thinking involved for the same functions on the
>Mac, but hey, I like it if it saves time.

Using a proper command shell like 'bash' saves a lot of time for me, because I don't have to spend time on locating the items I need on the screen or navigating the mouse. I just quickly type in what I'm thinking and it happens. Then again, the operations I do on the computer probably differs a lot from yours, which would explain why you might not have encountered this "problem".

>Yeah, PowerMacs are fun, and their price has gone down quite a
>bit(considering how much power you actually get, same w/ PCs)...

However, they go surprisingly slow compared to the hardware it has. The hardware is quite impressive, so why the h*** can't the programmers at Apple optimize the kernel properly?

>There were no programs that I truly "LOVED" that couldn't be replaced by
>more intuitive/more professional looking programs. I'm just curious,
>what programs do you currently use on a regular basis?

GenST, FirstWord+, ProTracker, ST Guide and diverse command shells.

>well as potentially studios around the city. I kind of feel that the
>Falcon(the limited "future" of atari?) has been reduced to a one-hit
>wonder... one program is now carrying its sales.

I think that has a lot to do with Atari's lacking ability to market the computer, as well as mass media enjoying to slash Atari and making people believe that Micro$oft or Apple are the only ways to go (and for that matter, to many people, PC and Mac are the only things that exist).

>However, if you want to do it all at home(and do digital recording...) go

>supported PC/Mac digital recording systems out there.

Blah! I tried some tracker programs on a 16-bit soundblaster on PC. The sound stinked! It was more noisy and inaccurate than what I got out of my M4STe when

I replayed the same module!

Well, I bought my Falcon in 1993 so at that time it really wasn't a bad deal. An LCIII system was a little more expensive for comparison (and I'd need to buy the keyboard :-)).
I think software on the Atari is underrated. It is powerful stuff and generally costs much less than that on a Mac. I use Pagestream, NVDI, AtariWorks, many games (Civ, Asteroidia, Pirates!, DM to name a few) and lots of other odds and ends. I think Pagestream and Atariworks can do what most college students want. The printout to a BJ-5 is very nice.
I view AUTO programs and patches differently than you. The Mac OS has some great features but it is so large! With GEM you can choose what you need with AUTO folder programs and save resources with what you don't need. TOS 2.06 and above has drag and drop as well as the ability to place files on the desktop. I can also configure my keys on the desktop ('O' to Open and so forth) and assign function keys to launch programs. I can also have long filenames with MultiTOS and a Minix partition.
I will concede that the Mac OS is easier to upgrade, though :-).
Hope none of this is seen as Mac bashing as I really do like Macs (I just like Ataris more). And I can understand why some people don't want to wait for good networking software when it is available elsewhere (though I think it will start appearing very soon now for Ataris).

Yeah, but too little too late. Atari has always been behind
the rest of the industry.

>I will admit that you have a great machine for networking. I
>wouldn't mind a Mac for that reason alone. However, software
>for the Atari will come out. It is only a matter of time.

I first had a 520STm and still have a 520STfm. Back then,
people were saying the same thing. Standard network interfaces
were againk, too late. I remember crazy net crap like MIDI
networks and cartridge slot interfaces etc.

>As far as the OSs what exactly can you do on the Mac that you
>can't on a newer version of TOS (2.06 and above)? I am
>curious.

How about alot. Don't get me wrong. When the ST first came
out, it was great. A GUI (which was a rarety in those days) on
a good stable machine that was pretty inexpensive. But sit
down in front of an older TOS machine today, GEM will drive you
up the wall, it has NO power. Again, as TOS versions went up,
Atari started to add the kinds of things that Mac (and even
Amiga) users were used to. These kind of things needed to be
implemented into the system from the beggining, not years later
when it meant every developer out there had to compoletly
rewrite their code, and even if they did, they had no way of
knowing who had what version. Plus, upgrades for older
machines were practically non-existent.

>The problem I have with Macs is that they look like they may end
>up like Ataris- great machines that should have made it but just
>didn't. It is hard to compete with clones and Microsoft.

Sad, but true. The fact is, that success in the marketplace
has nothing to do with how good your OS is, or how open your
system is, etc. etc. One look through computing history will
show you alot of goot machines sitting by the roadside for one
reason or another. Propriatary and hard to get hardware, hard
to get software, poor support, the list goes on. You can get
alot of these things right and still fall on your face, just

look at NeXT. In a way, Im sorry about it, I have always loved Atari's. But today the simple fact is, I can get more power, more easily and for less money with alot of other platforms then the Atari. Thats why I just have my 520STfm.

: my carts into my PS/2 77?

Considering they are a compact and readily available connector, then
don't you think it obvious that a designer would choose such a connecter
for the cart interface?? Besides, who says it's "microchannel"?? Just
because it uses the same connector doesn't mean it uses the same pin
layout, timing, and protocol (not to say it isn't).

Heck, the 25 pin D connector is used for more things than RS232.
Parallel and serial ports have 25 pin D connectors.

The 9 pin D connector was originally for joysticks. Now it's used for
serial ports and video ports.

Just because a PC board has a connector on it that is identical to
another doesn't mean it's the same.

Frankly, IBM has an excellent manufacturing and quality control facility
and reputation. They have been in the electronic manufacturing business
longer than anyone else. They are an excellent choice for Atari.
Besides, it relinquishes Atari from the financial burden and hassel of
manufacturing. IBM has the experience, why not let them do it?

It is a fact that the Jaguar is 100% Atari designed. It is manufactured
by IBM under contract with Atari. IBM is to make them, test them, and
ship them to Atari...nothing more.

Actually, prior to TOS 2 was the 32 meg partition limit.

>Duh... I do believe there is a little thing called MiNTnet, which supports the
>BSD socket implementation, and there are also even different network cards for
>Atari computers? Heck, there's even a version of Lynx compiled for MiNTnet, and
>if you don't like MiNTnet, you can always run Linux on the TT or better.

Yeah, you can always run Linux on other platforms too, the
networking will be better and cheaper. Every net solution on
the Atari has been a complete joke. Of course in Europe there
seems to be no such thing as standard platforms so anything
goes right?

<text deleted>

>"built in" is a very relative expression. AFAIK, 95% (percentage is a guess and
>I do by no means claim it to be accurate) of the MacOS is on the harddisk.

Which means it can get upgraded as it needs to cheaply and
easily. The Atari has never been able to do that. My 520STfm
is stuck on Rainbow TOS, and will be till it dies. OS
upgradability is vital for the future of any platform. Having
the OS on disk is only a question of disk space (not memory
like every one thinks, having the OS on ROM will not take much
less RAM.) which, now days, is not an issue at all.

>That's a filesystem problem, not an operatingsystem problem. With MiNT, you can

>seperate directories, but then again, that might just be me being too used to
>UNIX.

The filesystem is imbeded in the OS and so is a problem. Again
the UNIX/Linux argument is moot. The OS of the Atari has been
a problem from day one. Of course switching to a new OS could
solve the problem, but thats not the issue, the issue is the
SHIPPING OS.

>I don't have any problems putting files and program right on the desktop. As
>for linking files, that is again a filesystem problem and not an
>operatingsystem problem. If you run a Minix partition, you should have no

>problems linking files. Doing it on a DOS partition will not work, simply
>because the DOS filesystem specification does not support linking of files.

Your right, DOS doesn't support file linking. But the Mac (the
machine he was talking about) does, and has for years. Mac
users were able to easily upgrade to the new OS that had this.
Atari users had to buy a new system and even then (with their
upgraded OS) still don't have linking. Again your argument
about using another OS on the Atari completley misses the
point.

><text removed> Well, who said the ST was a

Great argument. WHAT professionals? The music arena maybe, as
a niche machine. And thats IT. Again, in Europe this may not
be a big deal, but having a machine that does what you need it
to do albet with diffuclty and having a machine that does what
you need it to do easily is an issue in those parts of the
world were self-punishment is viewed as foolish. As per usual,
the old machines that collect dust around here (for very good
reasons) are all the rage around there (I know cause I've lived
there).

>Using a proper command shell like 'bash' saves a lot of time for me, because I

>navigating the mouse. I just quickly type in what I'm thinking and it happens.
>Then again, the operations I do on the computer probably differs a lot from
>yours, which would explain why you might not have encountered this "problem".

As a Linux user, I agree, command line OS's are faster for
users who know what they are doing. But that was not the point
of the Atari machines and GEM when they came out. The idea
here is ease of use with as much power as possible. The Atari
ships with TOS, correct? Buying an Atari to run Linux and then
saying how great it is because now you have long filename
support "just like the Mac or Win95" or whatever is a bunk
argument. TOS/GEM sucks, it always has it always will.

>However, they go surprisingly slow compared to the hardware it has. The
>hardware is quite impressive, so why the h*** can't the programmers at Apple
>optimize the kernel properly?

This is definitly a problem. Every OS out there with the
exception of UNIX has severe size problems. The only reason
TOS doesn't suffer from this problem (at least not on the scale
of MacOS) is because it has less than half the features.

>GenST, FirstWord+, ProTracker, ST Guide and diverse command shells.

Oh please. Old news at best, not to mention that around here, those apps were slaughtered years ago by stuff ten times more powerfull and easier to use. Not to mention that, unless you want to order this crap from overseas, you'll have a hell of time getting it.

>I think that has a lot to do with Atari's lacking ability to market the
>computer, as well as mass media enjoying to slash Atari and making people
>believe that Micro$oft or Apple are the only ways to go (and for that matter,
>to many people, PC and Mac are the only things that exist).

This is, sadly, true. I remember when the first ST's were announced. I was thrilled. Having always had a love for Atari, the chance to own what was, at that time, one of the hottest machines in the world, was something I dreamed of for years. Atari's marketing in those days was good, but its association with the 2600 made people shy away from the ST's. Slowly, the marketing efforts of Atari went to the way side. Because they had been popularized in Europe (especially Germany), Atari moved marketing to there, and focused on only the niche market of musicians here in the states. Niche machines will all die eventually. It happended to the Amiga, it's almost over for the Atari, and the Mac is well on its way.

>Blah! I tried some tracker programs on a 16-bit soundblaster on PC. The sound
>stinked! It was more noisy and inaccurate than what I got out of my M4STe when
>I replayed the same module!

So your going to compare a SB16 to the Falcon. DUH! Of course the Falcon/M4STe will sound better. The SB16 is a HOME standard board. Trying looking at the true studio sound systems available fo the PC then try to push the Atari.

A few years ago when I found out about the Falcon I was thrilled again. I thought Atari was making a come back, then I saw the price, outrageous. No one in there right mind would pay that much for that machine. PERIOD. Not to mention I never actually saw the machine, only an add, and Atari has a bad rep for annoucing products that never happen. Atari is dead. I don't really like any better than anyone else. I still love my 520STfm (even though TOS sucks and its slower than crap) because I still love Atari. But facts are facts. Nothing can save them now, not niche software/hardware, not a TOS upgrade, not a replacement OS, nothing. I don't care if they produce a machine with better graphics, sound, expandability and software with a low price tag, they will not survive. There are simply too many stigmas that go along with the name Atari.

None of this is directed at anyone personally. Nor am I trying to make thousands of Europeans mad at me, the decisions on systems there have been good ones for other reasons. With the home being the true driving force for machines there, it actually helps the industry, because real people know how to

make decisions better than the suits of business. Thats what
makes our machines here in the states driven to more power, not
neccessarily better systems. However, this will slowly merge,
I believe into systems that, in the future, will be great for
both.

Larry,
You make some pretty bold statements. TOS/GEM is crap? Compare TOS 2.06 and above to Windows 3.1. Besides you can get replacement desktops like Neodesk (up to version 4) and Ease and Thing. Sure, it takes up memory but it is the same situation with the Mac. Ataris also have preemptive multitasking which I believe the Mac does not but you say Ataris are behind.
You say there is a lot of things you can do on the Mac's OS that you can't do on early versions of TOS. Does this seem fair? Why not try out Falcon 4.04 and tell us what you think. It is very, very nice although I will probably get Magix version 3 when it becomes available with Thing or Ease. What alternatives do you have on the Mac? I don't know of anyone using alternative desktops (besides At Ease).
If you want to give your 520 ST a shot in the arm then try out a new desktop like Thing (availible on the Net). And, again, long filenames are available with MultiTOS; you don't need Linux.
I don't think I was "stupid" to buy a Falcon 4/85 at the price of $1,300, thank you. At that time I could've bought an LCIII for the same price. I think I made the right choice. I enjoy using the Atari more than I would the Mac. Doesn't that matter?
As far as networking solutions, many home users don't need to network systems together. If they do a MIDI connection seems to be adaquate. What is wrong with that? My Falcon does have a Localtalk port, btw.
You mocked a person because the apps he used were replaced by (in your opinion) superior programs. This is subjective and if a person is comfortable with a program and it is powerful enough then why should he/she change? Or do you buy every upgrade immediately no questions asked?
Again, try Thing.
-scott tirrell

: Yeah, but too little too late. Atari has always been behind
: the rest of the industry.

Yup ... that's why it took Microsoft until 1992 to popularize
a windowing environment like the one Atari had in 1985. :-)

And with respect to the MIDI ports available on every ST ever
made, why it only took until ... until ..., HEY! MIDI ports
still aren't standard on a Clone!

Atari's latest machine (the Falcon, now available from C-Lab)
comes with a standard Digital Signal Processing chip, something
that's been standard on Clones since... since..., HEY! DSPs
still aren't standard on a Clone!

Yes, you're right. Atari has a *lot* to learn about keeping
up with the rest of the industry. NOT!

-- George

Besides, standard Clones aren't compatible with the ST and
won't run Atari software. Maybe someday the Clones will
catch up!

You are - of course - referring to the really existing 1 gig partition
limit in TOS >= 1.04, right?

TOS is one of the finest operating systems, that have been developed. It
elegant simplicity makes for elegance seconde to none. It has development
possibilties far advanced compared to the Mac.
The lng filenames are really no problem with MinT and Magic. I do not see
any point here. Mybe because of the fact, that the Mac does not have the
ability to load and use different filesystems without patches and tricks?
The usage of long filesnames is absolutely OK.
And - at what point does the Macintosh -depsite their hundreds of
programmers implement proper, premtptive multitasking? Even MS is faster
than Apple on that.

In Europe Sts and TTs are used professionally even in other areas than
music (where it had a 90% marjet share). And about the comfort problem.
Nobody is forced to use bash or anything like that. You can run such a
shell in a window parallel to a findre replacement such as Ease, Thing
that have lots more features than the Mac finder and are even easier tobuse.
And STs are very easy to use.

Look at it another way. The GEM system took a lot of the ideas from the
MAc but was in itsself a far better concept than the MacOS. It was
harwareindeoendent at a time nobody thought this would be an important
feature. It was easy to program, as easy to use as the Mac system, and by
far more expandable: Inclusion of vector fonts, prremptive multitasking
etc. is not an issue in the GEm world, that is because all the differnt
parts of the oprrating system function seperately and can be seperatley
replaced or omproved (VDI, AES etc.). There is no messing around with
countless "Managers" where you just need to change one bit and wverything
won't work.
You dio not like the DOS beased kernel? Fine, just replace it by a UNIX
one (MinT); Better graohics? Take NVDI
You do not have those huge compatibility problems as in MacOS when
upgrading (despite their thosands of pages of "Inside MAC"), just a few
rules and all GEm apps work even in most powerful environments. That is,
because systzem calls were aready prwepared for futuure applications.
Example: take the accesories, they are merely tasks with their own ID
even on Sinmgle tasking systems. The extension to multitasking was just
simple, abnd now take a look how the Mac prgrammers had to fight to get
multitasking on their machines (and how) from their old Pascal based OS
- this fact alone is laughable.

The quetszion of course is: Why dont the people use GEm then? And the answer is: Because of Apple.
Apple is the sole company that is responsible for a slow down in software development and for the ressouce slaughter nowaday. If it were not for them, PC and Atari users qould use GEM nowadays, run software several times faster than under Windows and have much more comfort than with the Mac. But no, Apple had to be against fre competition and free market, they wanted the monopoly on GUIs and took DR to court which took GEM to have2 fixed windows only. And we all know how things develop when monopolies occur.

Regards,

Alfred

2623. Sinclap Dogma Continues

Newsgroup: comp.sys.atari.advocacy
Date: 1995-09-03 00:00:00 UTC
From: dferran@crash.cts.com
Message-ID: <DECpF7.EA8@crash.cts.com>
Source record: 11478

Peter Sinclair-Day (PSD), the one and only sinclap2954@cobra.uni.edu,
leaped before he looked with (prior attributions lost):

: > : Yeah, but too little too late. Atari has always been behind
: > : the rest of the industry.
: >
: > Yup ... that's why it took Microsoft until 1992 to popularize
: > a windowing environment like the one Atari had in 1985. :-)

PSD: Eh, Beavis, that was 1990..

Wrong program! MTV is on *that* monitor over there. And thanks
for supporting my claim that Microsoft was way late after Atari
WRT windowing. And the key word is "popularize". That means 1992
is correct.

: > And with respect to the MIDI ports available on every ST ever
: > made, why it only took until ... until ..., HEY! MIDI ports
: > *still* aren't standard on a Clone!

PSD: Who the he** cares..

People who want a machine at the leading edge look for "extra"
features such as MIDI ports. If they don't want the standard
features on one machine, they can select substandard features
on *another* machine. Or substandard performance!

Like a Clone, which requires a '486 @ 66 MHz to perform benchmarks
in a time equivalent to the time of a stock (pre-C-Lab) Falcon.
Or a '386 @ 33 MHz to equal the performance of a stock ST (68000 @ 8 MHz).

Or a Mac -- I've had a chance to use a Mac II LC (68030 @ 16 MHz)
and it was noticeably *slower* from the user's perspective than an
Atari ST circa 1986 (68000 @ 8 MHz). What exactly does Apple DO
to their computers to cripple them so? Are they attempting to
maintain the same 4-to-1 frequency disadvantage maintained by the
Clones when compared to the Atari?

: > Atari's latest machine (the Falcon, now available from C-Lab)
: > comes with a standard Digital Signal Processing chip, something
: > that's been standard on Clones since... since..., HEY! DSPs
: > *still* aren't standard on a Clone!

PSD: Falcons don't do PowerPC or Pentium.

Didn't claim they did. How, exactly, is your response relevant to
my comment?

PSD: So were is all this dsp software?
^^^^

Send the $3.00 cover price to Toad Computers for their 54-page catalog of things Atari (570 Governor Ritchie Highway, Severna Park, MD 21146-2925), and look for "uses the DSP" in the software descriptions. With your keen editor's eye, you should have no problem finding them!

BTW: Remember to include your return address in the letter you send to purchase the catalog. We don't want the sure-to-follow online complaints that "...the catalog never arrived!" if you forget.

: > Yes, you're right. Atari has a *lot* to learn about keeping
: > up with the rest of the industry. NOT!

PSD: ROTFLMAO!!! [That represents a _lot_ of laughter, BTW :-)]

Glad you saw the humor in my comment. Some people don't understand wry, understated humor.

PSD: Atari software, what's that?

"soft*ware, n. In a digital computer, any of the programs designed to control various aspects of the operation of the machine, such as input and output operations."

In retrospect, maybe you actually *didn't* understand the humor.

-- George

PS -- There's a DSP standard in the Jaguar game system, too. How can the Clones and the Mac ever hope to compete on the basis of technology if they can't even keep up with the game consoles?

Just a little extra food for thought.

: In comparison to the Jagflop, the 3do is doing well despite the higher price.

It is? They've sold maybe 50,000 more machines in the US. Yes,
the price is higher, but so is the title count. The 3DO was supposed to
have an installed base in the millions by now.

: But, when 3do has had a bad quarter, its a different story..

Reread Nintendo and Sega's quarterly reports. 3DO is still in a
loss position.

: Who's fault is that? I can't find one..The point is that it is not how good
: the Jagflop could of have been, but how Atari handled it is the issue.

I think you aren't looking. I live in a City of about 100,000
people and can find the Jag at three different video game stores.

The article to which I replied claimed TOS 2.x had a 32 meg partition limit. I am aware that very very early versions of 1.0x had a 32 meg partition limit, but at the time these TOSes were the newest, very few even had harddisks, and those who did had "GIGANTIC" 20 meg harddisks. But yes, very early TOS versions had a limit, but I never saw any 32 MEG partition limit of TOS 2.06 or 2.05, which was the original claim I replied to.

>>Duh... I do believe there is a little thing called MiNTnet, which supports the
>Yeah, you can always run Linux on other platforms too, the
>networking will be better and cheaper. Every net solution on
>the Atari has been a complete joke. Of course in Europe there

I'd say that MiNTnet is a great solution. After all, MiNT gives you preemptive multitasking, and you get the BSD sockets implementation, which allows you to compile just about any BSD UNIX application on MiNT without too many alterations.

>>"built in" is a very relative expression. AFAIK, 95% (percentage is a guess and
>>I do by no means claim it to be accurate) of the MacOS is on the harddisk.
>Which means it can get upgraded as it needs to cheaply and
>easily.

The original claim I reacted to was the "built in" features of the Mac. We both agree that the OS is on harddisk, so I would not call it built in.

> The Atari has never been able to do that. My 520STfm
>is stuck on Rainbow TOS, and will be till it dies.

Not necessarily true, but very probable because:
o with a 68000, you have no MMU, so unless you upgrade from 512k, you would have very little memory if you run any OS in RAM.
o You do not sound as someone who would actually go to any lengths to install
it.

You can easily run new TOS versions from RAM. On Ataris with CPU less than 68010, you have no MMU, so RAM is a problem. On Ataris with MMU, you should be able to get virtual RAM, so RAM will no longer be that much of a problem.
I used to run TOS 2.06 in RAM (loaded from harddisk on boot) before I made a new image with WinX and burned it on some new EPROMS and put in to replace the old ROM. And by this, I'm not saying you need to burn EPROMs for an upgrade, I'm saying that you CAN run it from disk if you want to, but being able to burn

EPROMs makes life a lot easier. ;^)

>The filesystem is imbeded in the OS and so is a problem. Again
>the UNIX/Linux argument is moot. The OS of the Atari has been
>a problem from day one. Of course switching to a new OS could
>solve the problem, but thats not the issue, the issue is the
>SHIPPING OS.

AFAIK, since MiNT became the property of Atari, all Atari computers were shipped with MiNT on disk. That way, it was up to the user whether he/she wanted to run an old version of TOS, or a new version of MiNT. And yes, MiNT allows you to run different filesystems. And the nice thing is - just copy the filesystem driver onto the harddisk, and voila - support installed. It does not take a kernel recompilation to add a filesystem driver.

> Atari users had to buy a new system and even then (with their
>upgraded OS) still don't have linking. Again your argument
>about using another OS on the Atari completley misses the
>point.

Of course, as long as you run a DOS partition, MiNT will not be able to fix linking for you, simply because the DOS filedoesn't support linking. If you install a Minix partition, you _will_ get linking.
And please don't tell me MiNT is not TOS compatible, because - if you weren't aware of it, MiNT is Now TOS.

>><text removed> Well, who said the ST was a
>>machine for end-users? I like to see the ST/TT/Falcon as professional computers

>>people who knows nothing about how a computer works and has no plans whatsoever
>>to learn about them.
>Great argument. WHAT professionals? The music arena maybe, as
>a niche machine. And thats IT.

Programmers. I also hear it is used for calculating the stock market. But that's not the point. Atari machines are great to learn about computers on. A programer gets to know the operating system inside out, tear it apart, set it together again and alter it at wish. The experience a programmer gains from working on the Atari computers certainly makes Atari programmers better than other programmers - in average. Perhaps we learn to seperate software, OS and hardware, while others learn that Visual BASIC is a part of the PC standard.

>be a big deal, but having a machine that does what you need it
>to do albet with diffuclty and having a machine that does what
>you need it to do easily is an issue in those parts of the
>world were self-punishment is viewed as foolish.

As I tried to say above, the Mac is probably great for many people who wants to use the computer for DTP and accounting without bothering with what's going on inside the casing. Without ever learning "difficult words" such as "OS", "Filesystem" and "TCP/IP". But it certainly not a system _I_ enjoy working with.

>As per usual,
>the old machines that collect dust around here (for very good
>reasons) are all the rage around there (I know cause I've lived
>there).

Perhaps it is a long time since you've lived here. We have pentiums, too. In fact, I've got something like 11 pentiums in my office, ready to hardcopy a harddisk image onto every harddisk in them, install network cards and then put them out in different offices here at the city hall. The universities here use Macs, PCs and Indy workstations to name a few. University students tend to prefer X-windows, and I don't blame them.

>As a Linux user, I agree, command line OS's are faster for
>users who know what they are doing. But that was not the point
>of the Atari machines and GEM when they came out. The idea
>here is ease of use with as much power as possible.

For an end-user, yes. But my point was - the Atari is not for end-users, so don't come with the "It's no good for an end-user" argumentation, PLEASE! ;^I

> The Atari
>ships with TOS, correct? Buying an Atari to run Linux and then
>saying how great it is because now you have long filename
>support "just like the Mac or Win95" or whatever is a bunk
>argument. TOS/GEM sucks, it always has it always will.

Atari ships with MiNT as well as TOS. This also gives you long filenames. And MiNT is Now TOS (as stated above).

>>However, they go surprisingly slow compared to the hardware it has. The
>>hardware is quite impressive, so why the h*** can't the programmers at Apple
>>optimize the kernel properly?
>This is definitly a problem. Every OS out there with the
>exception of UNIX has severe size problems. The only reason
>TOS doesn't suffer from this problem (at least not on the scale
>of MacOS) is because it has less than half the features.

Duh - sounds a bit strange to me. The more features an OS has compiled into the kernel, the less the program has to do itself, and the smaller the programs get. The less features an OS has, the more the program needs to do itself, and the bigger the programs. The best reason I can see for Atari programs to be as small as they are, is simply that Atari programmers are better programmers. And the best reason for them to be better is because they learn to put limits on their programs. I had to work with a half meg limit for ages, but I learned a LOT about optimization from it. The reason Windows programs get so big, however, is that each program is built on a function library which is built on a function library which is built on ... which is built on a DLL which is built on a DLL which is built on ... which is built on a set of original windows funtions which again build on DOS. GEM/AES/TOS does not suffer from the same problem because it was built from scratch.

>>GenST, FirstWord+, ProTracker, ST Guide and diverse command shells.
>Oh please. Old news at best, not to mention that around here,
>those apps were slaughtered years ago by stuff ten times more

>powerfull and easier to use.

GenST ==> I used to use TurboAssembler, but due to an ugly bug which ruined the font when I accessed a harddisk parition with 16k clustersize, and because it goes directly on the old chipset and I have an ET4000AX VGA screen card, I go for the next best. GenST is an excellent assembler for GEM, and it can even be used when I'm in text mode (like GCC, kind of. Oh did I mention that I enjoy using GCC, too?)

FirstWord+ ==> Excellent for editing ASCII files without stopping to fix on the font to make it look nicer. When I write documents, I want to consentrate on the contents, and not on what it looks like. The contents is far more important. What it looks like can be changed with another program later. For the same reason, I use pico for text editing at work.

ProTracker ==> Might be old, but it's a damn good program to edit modules with.

ST Guide ==> And what's wrong with ST Guide? It's an excellent way to put your documentation and any other documents from your harddisk in a hyperlinked system.

>Not to mention that, unless you
>want to order this crap from overseas, you'll have a hell of
>time getting it.

Ok, so GenST and FirstWord+ are British products and needs to be ordered from GB. However, ST Guide and ProTracker are shareware and available from Atari.Archive.Umich.Edu

>Slowly, the marketing efforts of Atari went to the way side.
>Because they had been popularized in Europe (especially
>Germany), Atari moved marketing to there, and focused on only
>the niche market of musicians here in the states. Niche

Which marketing in Europe? The best marketing I saw was an ad for "the New Atari Computer" with a picture of the 2600 - and that was in 1993!!! No. I can't say Atari has been very good at marketing in Europe. It might just be Scandinavia that is bad, though...

>So your going to compare a SB16 to the Falcon. DUH! Of course
>the Falcon/M4STe will sound better. The SB16 is a HOME

I'm comparing SB16 to an M4STe. For your information, the M4STe has the same soundchip as the STe: 8-bit * 2 channels at 6,12,25 or 50 kHz. Both channels have to be at the same speed, so playing a tracker module is a matter of resampling all four voices to replay speed and then _adding_ them, so you'll actually loose one bit on each tracker channel to fit into the 8-bit audio channel. And it STILL sounded better than the SB16. This is because the SB16's DA-converter is far too inaccurate to even be called 16-bit!

>standard board. Trying looking at the true studio sound
>systems available fo the PC then try to push the Atari.

The original article I replied to gave its blessing to SB16. I _know_ that you get better soundcards for the PC - at one hell of a price - but you get better soundcards on the Atari, too. Any card you get on the PC, you can also install on you MSTe or TT. It's just a matter of time before you have the bus-convertion card on the Falcon, too - it might even already be there for all I know.

>A few years ago when I found out about the Falcon I was
>thrilled again. I thought Atari was making a come back, then I
>saw the price, outrageous. No one in there right mind would
>pay that much for that machine. PERIOD.

I don't know. The DSP56001 is the heart of many synthesizers that cost a lot more than the Falcon. And the Falcon can be programmed to emulate these synthesizers. The 68030 is worth a lot of money, too. And the DA and AD converters... With that hardware, I think the Falcon had a fair price.

>Not to mention I never
>actually saw the machine, only an add, and Atari has a bad rep
>for annoucing products that never happen. Atari is dead.

I don't have one - Kai has one. I never got one because I'm saving money to pay down a loan and moving to Canada. However, the Falcon certainly exists and it works just great. Atari is not dead quite yet.

>don't really like any better than anyone else. I still love my
>520STfm (even though TOS sucks and its slower than crap)

It's strange... TOS/GEM/AES is faster on an 8 MHz 68000 w/0.5Meg RAM than Windows is on a 66 MHz 486DX with 8 Meg RAM... Then again, it is also known that intel-based programs need approximately three times the size of what a motorola-based program would need to do the same job. And DOS's usage of unprotected mode doesn't make things any better.

>None of this is directed at anyone personally. Nor am I trying
>to make thousands of Europeans mad at me, the decisions on
>systems there have been good ones for other reasons. With the
>home being the true driving force for machines there, it
>actually helps the industry, because real people know how to
>make decisions better than the suits of business.

So did the "real people" do the right decision when they bought VHS? Beta was a lot better, and professional TV stations use Beta instead of VHS for better picture quality. And both Cern and NASA use VME-based systems. They use SCSI rather than IDE, while the "real people" settle for IDE. No. The "real people"'s decision has a lot to do with marketing. Most people don't really know what they are buying.

>Thats what
>makes our machines here in the states driven to more power, not
>neccessarily better systems. However, this will slowly merge,
>I believe into systems that, in the future, will be great for

This post is kinda of a sorry about that, thanks for the corrections, here is my overall point.

1. I apologize for my rather rude posts regarding Atari's. As I have tried to establish with those who have responded, I truly love Atari and their system. My anger was not really directed at anyone here, but rather at Atari. My cynicism is a direct result of the absolute foolish way they have run Atari. It is the reason that the Atari is barely a memory here in the states. It is the reason that I can't get a good Atari, or hardware or software, or even upgrade my system without going through hoops which are on fire and placed over shark infested waters.

2. Thanks to all of you who have corrected my mistakes. I have, unfortunatlly, it is very difficult to keep up with what is current in the Atari world. I was out of place on some things because I am basing them off of older HW/SW. One excellent point was made about TOS/GEM. Its standard HW indepented programming interface makes it so that old software runs without problem on newer versions of TOS. I do however have a problem with software not taking advantage of newer OS features. However this is a problem in computers as a whole not just on Atari's.

3. My overall point is, here in the states, Atari dropped the ball big time. Even in Europe, marketing was done half-ass. My main example being the UK (where I lived for about 3 yrs) where the ST was pushed as mainly a games machine. Games have been an Atari stigma here since their inception. Many people did not/do not take Atari computers seriously. Hence, Atari is practically non-existant in this market. Atari also brought out many features, both hardware and OS, long after they should have, and at prices that did not compare well with other machines. The "Power without the Price" line seemed to have slipped through the cracks somewhere in Cupertino. I also have been very upset by Atari's track record of hardware announcments that never came to be (i.e. vaporware). No one will buy it no matter how great it is, if you don't make it available to them.

I do love Atari and their computers. I have, thanks to the prompting here, decide to dust off my old 520STfm and crank her up. If I do decide to perchase a Falcon, it will ceartainly be because I was willing to run the guantlet for a good machine.

The deciding factor there will be price/performance.

I again wish to be sure that I did not mean any one person here any harm or aggravation. My frustration was vented on the wrong group. Perhaps someone has the address to Atari HQ?

yours,
Larry Carter

This is fun...Eh, Butthead the Mac LCII(have not been sold in years) was
probably running under 16 bit color on 16 bit bus. Apple did cripple the
machine bus wise. I bet that if the LC II was running in four bit color such
as the Atari ST, the LC would eat it.

>a windowing environment like the one Atari had in 1985. :-)

Agreed, and to be honest, I hate windoze as much as any one
else. However, at the time of Rainbow TOS (what I have on my
520STfm, GEM was pathetically underpowered. My main concern
here was that Atari waited to long to add the kind of features
that any user (beginner or power etc etc) would want to make
using the system easier.

>And with respect to the MIDI ports available on every ST ever
>made, why it only took until ... until ..., HEY! MIDI ports
>*still* aren't standard on a Clone!

I was not refering to MIDI ports for one thing. I have always
been a firm believer in Ataris market in MIDI. However, I was
reffering to standard hardware from an industry standard. It
just happens that because of clone popularity (right or wrong),
they happen to cause these standards. The clone provides one
thing that the Atari doesn't (at least not as easily),
upgradability. Putting a 1GB SCSI drive into your Falcon will
cost you at least twice as much as a 1GB IDE drive. Now
granted, the SCSI drive will perform better. But that is not
always the issue.

>Atari's latest machine (the Falcon, now available from C-Lab)
>comes with a standard Digital Signal Processing chip, something
>that's been standard on Clones since... since..., HEY! DSPs
>*still* aren't standard on a Clone!

You are correct, however, getting an expansion board with the
features (including DSP) you want is available, it provides a
bit more flexibility.

>Yes, you're right. Atari has a *lot* to learn about keeping
>up with the rest of the industry. NOT!

Tell me something, where does one purchase an Atari, hardware,
software, the neccessary 3rd party books. OH thats right, I
have to ORDER it (note dry humor exchange). And there lies my

biggest problem with the systems (next to price), it is ten times more difficult for me to get what I want Atari wise.

>Besides, standard Clones aren't compatible with the ST and
>won't run Atari software. Maybe someday the Clones will
>catch up!

So what, Atari's won't run current PC titles either. That's not why I bought a PC, or an Atari, I bought them so I could run Mac software right?

My main point is, how can I justify a Falcon, which I have to order from Toad, when for the same money I can get a quality PC system from right around the corner. Believe me, I would love to have a Falcon. And as a true Atari fan, I probably will buy one just for the hell of it.

Larry
P.S. Anybody got the phone number/address of Toad? (no joke)

>how to run a computer he's our network administrator.

what is win95 stuff doing in the jag newsgroup? it seems anywhere i go,
win95 is there. let me re-iterate why win95 should be disposed of:

1) not a real 32 bit OS
2) no CDROM-cache, disk-cache, memory-cache protection
3) no real pre-emptive multitasking with 16 bit applications running

there's more, but i'd rather not take up more bandwidth.

ObJag: Eagerly awaiting my JagCD when I get it from the UTC EB tomorrow.
The one thing that this JagCD will make worth purchasing is the
virtual light machine. Hell, no other CD consoles have that.

why does this thread keep coming up??? win95 discussions don't belong
in here! in response though: a lot of die-hard PC-people don't want to
buy Win94 because it is a bad product and won't make things too easy or
easy at all if you want to do real work. i for one won't buy it.
os/2 rulez!

ObJag: The no software argument against the jaguar has always seemed to be
the same argument for other less known operating systems and products.
OS/2 vs win95. macintosh vs. PCs. laserdiscs vs. videotapes.
One product is obviously better than the other and yet the sheep
inevitably go for the bad product with the bad (but plentiful) software
which further degrades the amount of software available for the better
product. incredible, simply incredible. Yet another case of
style over substance. Hype, bells, whistles, smoke and mirrors.

Eric Rotbart wrote:

>... On a different note, I'd love someone at IBM to explain the advantage of
>MCA (I use Warp, and I'd love to know the advantage over ISA).

The ISA standard dates back even before the launch of the IBM PC (in 1982).
The original 8 bit charater of ISA made it the weak link in a PC (that is
your chip is able to use a 32 or even 64 bit data path on the mother board
but only a pedestrian 8 bit path for I/O activities involving ISA adapters).

Microchannel advanced adapter design to catch-up a bit with advances in
microelectronics. 8, 16 an 32 bit slots were offered; the latter long before
equivalent throughput was offerred by other means (like local bus, VESA, SCSI
etc.). Microchannel cards were also usually self configuring (and could shareDMAs).

Nobody questions that MCA was (and is) better than ISA. The problem was simply
that those people who insisted on the development of MCA wouldn't buy it. ISA
was too successful and had too much (unearned) momentum in the market.

There are many other examples where a forward looking design wasn't given a
fair shake in the marketplace. The Atari ST is among them.

Larry,
You could always e-mail them at atari@genie.geis.com. I got a response.
Unfortunately, Atari has dropped all computers. You may want to
consider a C-Lab if the price is decent (same as Atari Falcon) or
a used TT or Mega STe. I have also heard of a TT clone running at
48Mhz from a dealer in Canada (Computer Direct?) that sells for around
$1,000.

Actually, as I remember, the ISA bus was used in the IBM PC/AT, not the original IBM PC. The original PC bus was an 8 bit bus, the ISA bus was 8 or 16 bits but it only allowed transfers at 8 MHz.

>Microchannel advanced adapter design to catch-up a bit with advances in

I worked on an MCA card development project in 1991. It is a good architecture but, if I remember correctly, IBM licensed it. It wasn't freely available for other computer manufacturers to use. As far as I know, IBM was the ONLY company to manufacture systems that used the bus and only in their PS/2 machines.

When the PC clone makers wanted a faster bus they went to the EISA architecture which was an open standard. The EISA bus is an extended ISA with 32 bit slots and transfer rates of about 33 MB per second.

So, it seems that it wasn't really the market that killed MCA, it was the marketing.

Steve Hanka

How much is the PSX going to be selling for? Last I heard was that Atari & 3DO were thinking about a dumping suit if it was too cheap. Any thoughts on this?

Peter Sinclair-Day, the one and only sinclap2954@cobra.uni.edu
continues to expostulate with:
: > PSD: Eh, Beavis, that was 1990..
: >
: > Wrong program! MTV is on *that* monitor over there. And thanks
: > for supporting my claim that Microsoft was way late after Atari
: > WRT windowing. And the key word is "popularize". That means 1992
: > is correct.

: Eh, Butthead it was Apple that popularized the windowing environment, not
: Atari.

Apple had it second ... after Xerox PARC ... and there was immense
resistance to windowing environments until Microsoft's advertising
blitz in the 1990 - 1992 time frame.

: You mean Pentiums and PowerMacs have substandard features and Performance?
: Eh,
: Butthead you have not read the specs as well as price.

So where are the standard MIDI ports? Where is the standard DSP chip?
Where is the efficient operating system that will run in 1 Meg of RAM
(or less)? Where is the processor-direct port (I'm thinking Falcon,
here) that allows designers to completely take over the hardware?

: > Like a Clone, which requires a '486 @ 66 MHz to perform benchmarks
: > in a time equivalent to the time of a stock (pre-C-Lab) Falcon.
: > Or a '386 @ 33 MHz to equal the performance of a stock ST (68000 @ 8 MHz).
: >
: Eh, Butthead do you have evidence to prove this?

Back in 1993 or so, when Digital Equipment Corporation was unveiling
it's new "alpha" microprocessor, they had a display showing the
benchmark times of several computers. Those times were (now this is
from memory, here):

Apple Mac Quadra 12 seconds
Clone '486 @ 66 MHz 6 seconds
Alpha (details?) 5 seconds

Two hundred feet away, the Atari Falcon was running the same benchmark
in 4 seconds. Pretty good for 16 MHz, eh?

... and the comparison of the ST to the '386 is based on personal
impression, not by any testing.

: This is fun...Eh, Butthead the Mac LCII(have not been sold in years)

... the ST has been around for many years. Since they're both showing
about the same amount of age, it's fair to compare them. Right? Or is
it not fair because Atari's 8 MHz 68000 runs better than Apple's 16 MHz
68030?

: was
: probably running under 16 bit color on 16 bit bus. Apple did cripple the
: machine bus wise.

Thank you, Peter. (That's a sincere compliment, BTW!)

: Pentium and PowerPC with slots as well with low prices are not
: standard on the clone. Top of the line Falcon clone in 1995
: is an 030-16 mhz is absurd.

A machine that outruns a DEC alpha system while running at 16 MHz
is absurd? Sounds like a technical achievement to me....

: > Send the $3.00 cover price to Toad Computers for their 54-page catalog of
: > things Atari (570 Governor Ritchie Highway, Severna Park, MD 21146-2925),
: > and look for "uses the DSP" in the software descriptions. With your
: > keen editor's eye, you should have no problem finding them!

: One.

Look again. Without study I remember a minimum of two graphics and
retouching programs that make use of the DSP.

: > BTW: Remember to include your return address in the letter you send to
: > purchase the catalog. We don't want the sure-to-follow online complaints
: > that "...the catalog never arrived!" if you forget.
: >

: I got one..Not much for dsp specific apps.

Well, that's an improvement from your inference that there weren't
any DSP applications.

:As much as the titles avilable for the Jagflop..

That was the refrain from the major players in the personal computer
industry when CP/M was the standard operating system and upstart IBM
decided to go it's own way. There were Darn Few Titles [tm] available
for IBM PCs for the first few years, and everyone was conviced they'd
take a pounding in the market and return to The Standard.

If you take a survey today, you'll find that few people even remember
that CP/M means "Control Program for Microcomputers".

: Eh, Butthead the clones and the PowerMacs sell in the million annual.

Chevrolet sells millions of econoboxes, but I'll take the Corvette,
thank you.

: The Jagflop has not set the world on fire...

Hasn't it already been proven that *none* of the game systems have set the world on fire? Yet, anyway?

$299 is not cheap? The local Software Etc has 24 PlayStations in stock for Saturday's release with tons of titles. However, all have been pre sold and the titles will all be sold by noon. Not much Atari can do about it. Will Sam sue Sony for pricing the console at $299 like he said in NG? Not a chance..

Ok... Ever hear of IBM's Mwave? This is a DSP based subsystem that's an option for the ThinkPad line. Flame me if I am wrong, but we have a 755 with the Mwave in it, and it has all the features of the Falcon's DSP: great sound, software modem, and all that.

Unfortunately, it is made by IBM, and anything made by IBM has many inherent flaws: First, the price is probably astronomical. Second, IBM is IBM. They suck almost as bad as Atari in marketing. Third, they propriatise (?) everything, meaning that they let no third party vendors develop.

Not only that, but, as I said above, probably won't work on
Alpha. There are clearly DSP products out there for PC's (i.e.
Intel/Intel clone processors) But it takes more than a PCI
card, it takes drivers. Although porting these drivers to
WIN/NT (a OS option for the Alpha) would probably be pretty
easy. My point was that EACH system has their own unique
values. And without specific apps that take advantage of each
of these features, benchmarks would be crippled by bad OS's
running on otherwise awesome hardware.

Larry
My opinions, not always Intels.

Actually, I take it that the alpha was running a UNIX-like operating system,
and so it would be running a WHOLE lot more processes than the Falcon would.
Even so, the X-windows system is a layer on top of the actual operating system
in UNIX, and so it is just natural that an OS that goes as direct on the task
as TOS does works faster. And I take it the Falcon was _not_ running MiNT
during the test. I think the result had a LOT to do with the missing overhead
on the operating system on the Falcon. But the Falcon still have too much
overhead. I assume the 486 was running Windows. I am certain it would perform a
lot better under Linux...

Absolutely correct! You would think after over a decade of
loss at Atari they would figure out that their whole problem
has been MARKETING! I have seen only a couple of commercials
and no ads for the Jag. That combined with extremly poor
distribution of the systems/accesories/carts. What does Atari
expect, miracles? I too thought about buying a Jag (have a
Sega right now) but, I remember when I bought my 5200, 3 months
later, one of the controllers went bad, then about 2 months
later the other one went bad. No one had replacements, carts
were non-existent, on and on. I don't want a repeat of history
with the Jag.

: Absolutely correct! You would think after over a decade of
: loss at Atari they would figure out that their whole problem
: has been MARKETING!

Considering their actual size and sales, Atari pumps a pile of
$$$ into marketing.

I have seen only a couple of commercials
: and no ads for the Jag.

Look in any video game magazine over the last year and a half and
you're almost certain to see ads.

That combined with extremly poor
: distribution of the systems/accesories/carts.

This is a problem, but it is getting better. Radio Shack, Walmart
and Software etc signed on, so it looks like even Sinclap will be able to
try a Jag.

What does Atari
: expect, miracles? I too thought about buying a Jag (have a
: Sega right now) but, I remember when I bought my 5200, 3 months

The Alpha would have been running Ultrix (DEC's UNIX) at that
time and have since dropped it (for performance issues) and
replaced it with DigitalUNIX which should perform much better.
Although I agree that the Alpha probably had alot more OS
overhead than the other machines, that proves very little.
Which is my problem with benchmarks between different
OS/Platforms. So many factors are left out of benchmarks that
they protray very little real value. The Alpha is clearly a
superb chip with awesome performace. It has a PCI bus which
not only provides flexible upgradability, but awesome bus
performance. The graphics cards you can get now days for PCI
will blow you away. To the Falcon's credit, it still has the
DSP no one else has, and I am not aware of availability of
equivalent hardware for the Alpha. Obviously the Mac and PC
will have lower benchmarks because, at that time, they were
using bad buses (both now have moved to PCI) and they had (and
still have) extremely top heavy OS's. This seems to be the
trend today. I think the real benchmark test would be a game,
in all seroiousness. Develop the same exact game for each
machine, designed to advantage of each machines specific
advanced features. Since most games utilize the systems full
bandwith (not just processor), it would tells alot about each
systems true performance (video, sound, bus speed for HD/CD
access, memory utilization etc.). Of course no would be able
to do this, but it would truly show who's who out there.

Larry
These are my opinions not neccessarily Intel's.

I think one reason why Atari won't or can't advertise in the main-stream print media like Newsweek or Time is because of cost. Atari even in good times never spent much $ for marketing and advertising and these mags cost major bucks that Atari won't want to cough up...

Why don't they advertise on the internet or on one of the online services? They can provide more interactivey than Time magazine, the lead-times are probably shorter, its probably less expensive, and you're still reaching the same audience.

I know because that's what I do for a living! I help design and build sites for major corporations who want to go online.

Hey, that's an idea! Does anyone know the e-mail address of Atar's marketing director? I'll talk to him! :)

Ari

Just want to let you guys know that GoldStar have launched a big 3DO fair here in Singapore. All major Computer Retail Buildings have large exhibition at their foyer/lobby.

3DO have landed big in Singapore.... the Jag have still to make an appearence.

Regards
William

Sounds like you were frightened by a 360 as a child ;)
Actually, the MWave is the DSP card of choice among many
developers. For ~$300 you get the card and the development
software...hardly astronomical. The quote about their software
lock is pretty strange and about 25 years out-of-date. Are all
Warp9 packages theirs?

It's a 32-bit pre-emtive multitasking system, that is TOS-compatible.
It's faster than TOS and a LOT faster than MultiTOS!

And it's also avaiable for 68k Macs and PowerMacs!

Keep Cool and Flying...

I must admit, I have an extremely large negative bias towards IBM. I've worked in an IBM mainframe shop for many years, and have seen many extremely bull-headed decisions to buy IBM just for the sake of the name...

I was unaware of the cost of the card, which I qualified in my post; but $300 is not a lot of money. Also, my mention of propriatory (sp?) doesn't date back 25 years, but only very recently. Namely MCA. It may be good, and it may be the best, but IBM felt extremely burned by what happened to the original PC/AT, and put a lock on MCA development. That hindered them badly.

Regarding OS/2... I get the shivers recalling the administrative night-mare this was. Running OS/2 LAN server was like taking a bull by the horns. There were just too many layers involved in anything: first the base operating system. The the LAN server software was a seperate package. Then, the print server software was yet another seperate package. We've switched to WinNT, and even tho I am not a mindless clone, who bows down to Bill Gates, WinNT Server is a much better network environment. There are no layers. The networking is built into the system at such a low level, it's almost impossible to seperate them out (but it is possible to run in a standalone environment). The print server was just another minor peice of software, included in the base OS.

What's my point? As above, I don't like IBM. I've seen better, but I've also seen worse.

Atari didn't "drop" Germany, but did scale back their entire
European Operations. I think it was a mistake *NOT* to keep the Atari
Germany office open, although there are probably financial reasons
involved (ie. it was cheaper to handle European Atari distribution out of
the Netherlands and UK than Germany) that I don't know about. The Jaguar
and other Atari products are available in Germany.

Yep and how about pricepoint? Atari can manufacture the Jag here & sell it for a profit at $149 while the Saturn comes in at $399. Flame away on this statement if you must but the two machines are practically the same in performance terms & it'd make sense for a major player like Sega to want a machine to undercut Nintendo & Sony in the price wars while maintaining a high level of performance.

> Considering their actual size and sales, Atari pumps a > pile of $$$ into marketing.

It's not dollars that make your marketing good or bad, it's
your marketing. What I mean is, that you can spend all the
dollars you want, but if all your marketing is centered around
ads in Better Homes and Gardens, there is not much chance your
going to succeed.

> Look in any video game magazine over the last year and > a half and you're almost certain to see ads.

But that's part of the problem. Their preaching to the choir.
The same problem plagued the ST's. Atari only advertised them
in Atari and music magazines. Those people, for the most part,
already HAD Ataris. They needed to push the machine into the
market place as a whole. For those out there who are getting
ready to buy their first console, TV commercials, a lot of
them, are what really push a product. How many commercials do
you see a day for Sega and Nintendo (now Sony too), and we
wonder why they outsell the Jag.

>> That combined with extremly poor distribution of the >> systems/accesories/carts.

> This is a problem, but it is getting better. Radio >Shack, Walmart and Software etc signed on, so it looks like >even Sinclap will be able to try a Jag.

Not to mention, the price has gone down to $150, very nice. I
just hope it's enough.

> [snip] though you should point to another example. The >5200 was discontinued before the Tramiels ever had anything to >do with Atari.

It really doesn't seem to matter who is running Atari. When
old Sam got ahold of Atari, it seemed he was making a change,
for the better. But then it all went down hill. Yes, the 5200
was gone, but it's a good example of Atari's lack of commitment
to its products/customers. History shows that Atari will drop
things like hot potatoes if they aren't doing what they want
them to do. So I go and buy a Jag, and next year, I won't be
able to get cart's, replacement stuff, etc etc. You can
understand why I would be reluctent, although the price is VERY
tempting.

Don't fool yourself, this is exactly how they got out of the
US, albeit indirectly. It's not news to everyone that for
years, Germany was where Atari had their largest market share.
So how could it be that it would cheaper for them to run their
operations out of the UK? It's NOT. I think that Atari is
doing it on purpose. To kill themselve from the computer
market. They think their failure is immenent in the console
market so they are setting up for one of two possibilities.

1. Push to almost bankruptcy hoping that some big-wig money
bags (another Tramiel) comes along to bail them out.
2. Push to bankruptcy. They don't care anymore and go home
without any real problems. (Thats the point of bankruptcy to
companies apparently.)

Sound silly, but it happens a lot more than you think. Atari
is ceartainly not above this kind of thing

: I am late coming into the Atari news group, what is coming this Fall
: and is Atari on it's last leg?!?!?

Who knows what is coming this fall? I suspect a $99 Jaguar, a
Jaguar with a good pack-in (ie. Doom), some reduced prices of games, the
CD-ROM, more games and that's probably about it. Atari's sales are
miniscule, but the downsized, cash infused company is in better fiscal
shape than ever. Whether it can compete or not against the big guys is
questionable, but I respect the way Atari has changed over the years. If
only they'd made these changes years ago, it might be easier selling Jags
now.

>Your guess is good as mine..

EGM said the same thing. They already own 7.4% or 4.7% of Atari (can't remember which) from the patent deal. As far as I know this is unconditional stock, and cannot be sold. They already own part, why not go for more, seeing that the Saturn's price tag is too high for many U.S. gamers, and the Jag has at least 150,000 owners in the U.S. alone. Plus, Sega games on the Jaguar (another part of that patent deal) could hurt them more in the U.S., so why not capitalize by releasing all their arcade/home games on the Saturn first, then in say, 6 months, put them on the Jaguar. Hits both price levels, and makes it so there is a demand to get the games first, so the Saturn will be bought by as many as can afford it, and those who can't still have the Jaguar to get the games. Sounds logical to keep their standings in the U.S. market. Plus, with the Sega name on it, more will buy the system, and more third party developers will join as well. Good reasoning, but let's wait to see what happens.

Atari din't just scale back their business in Germany. That's how it started, OK, but two to three months ago, Atari camcelled all treaties and supportfor all Atari fealers in Germany.
And that is far different from just "reducing".
This means also, that it is becoming enormously difficult to get spare parts for the machines (even newere ones, such as the TT etc.)
Atari Holland seems to have closeddown also, according to news. The remaining Atari stock, was purchased by a company called ACN in Holland, where one could get hold of keyboards, casings, defective monitors etc.
Ataris onyl remaing product is the Jaguar and rest assured that although I would have liked to see one there is not a single electronic chaine over here that has them. A small shop, specialised in games consoles, had ordered some from the US and dropped the Jag six months ago! (One person that asked about it in three months ans that was me :-( )
Germany seems to have at least one shop that sells them (called Pagedown), but for the whole of a country????

And as for Atari to go into liquidation by free will - don't cunt on it. The Tramiels could have sold their computer line to other producers, when they still had good market chances (i.e. in the music market). They decided to keep the rights to the line to themselves and just allowed for licenses to their machines with dubious terms (such as you have to have the prive higher than that of th orogibnal Ataris).

Now they said they would concentrate on the Jag. Ridiculous, with almost no capital left, they started donsizing to a middle size company. And - if the banks do not stop them NOW or if not another company makes an offer far above the current market calue of Atari stocks- the Tramiels will continue to downsize their company.

They will probably drop the Falcon and start to be games software onyl producers. And beacuse even there they will not have success, they will start to downsize till they vanish completely.

So the best thing to hope for the Jaguar owneres is that the banks make an end to the Tramiel era and the Jag gets a good cpmpany such as Sega to carry on. For the computer line it is too late.

Reagards,

Alfred

This is a sound, logical theory, how much do you want to bet
that it's NOT what will happen, although it should be what
happens. I think it would be great for Sega to grab Atari and
infuse this kind of life into the Jag. However, more than
likely, if they do get Atari, they will do it to kill the Jag,
removing one more console from the face of choices against a
Saturn. Although we know, and probably Sega knows, that the
Jag is a nice piece of HW, it will be viewed as an outsider, a
non-Sega as it were, and dropped. Well, we'll just have to
wait and see....

>Your guess is good as mine..

Huh? Three problems with that rumor

1. It is a rumor. And you know what happens to those rumors.

2. A Sega take over rumor is not a good news for Atari. It appears that
Sega take-over rumor is always associated with companies in
financial trouble, like that Sega wants to buy 3DO rumor meant 3DO
was in financial trouble.

3. There is nothing in Atari that Sega would possibly want. The
patents? Sega already paid for that. Beside, those patents would
expire anytime soon. Jag2? Yeah, Right!

Ah, I suppose it is better than being mentioned for bad things such as the problem Apple is having with shortages of Macintoshes. WSJ had some dire predictions for the computer line from the big fruit company lately.
As far as the Jaguar goes, I predict that Atari's major ad campaign will actually materialize and will raise a few eyebrows. The Jaguar has such a good price advantage that it will make Atari profitable (I do not think it will be the dominate system, however). I am still unconvinced that gaming systems priced at over $200 can sell in significant numbers.
BTW, I also predict that Atari's CD-ROM games for the PC, when released, will sell quite well.

What is with all these "Sega is buying" posts. I've heard that they are
trying to buy both 3DO and Atari! This is strange, unless they are
looking to dismantle some of their competition. Personally, I think Sony
is going to give them the fight of their lives and they'd better keep
their guard up lest Sony do to them what they did to Nintendo.

Peter I called the WSJ and talked to Jeff Trehenberg who authored said article. He played Doom on the Jag and found it wanting. He also attended an Electronic show in Las Vegas ,and was treated poorly by Atari. I told him to play T2k, IS, and WMCJ. Also the VLM. I said Ted Hoff and JAG 2 were other positive develoments. Call the WSJ Jeff will call you back.

Actually, when you can't fulfil orders because of the sheer volume of
them it makes your system look very desirable in the public eye. Although
abviously the situation has been bad for Apple, it doesn't look as bad as
the great Jaguar CD affair has been for Atari.....

: As far as the Jaguar goes, I predict that Atari's major ad campaign
: will actually materialize and will raise a few eyebrows.

How many times has THIS been said before?

: The Jaguar
: has such a good price advantage that it will make Atari profitable
: (I do not think it will be the dominate system, however).

Price advantage is nothing - it just puts the Jaguar into the budget
SNES/Sega sector of the market where it will be killed by the superior
software libraries of its budget competitors.

: I am
: still unconvinced that gaming systems priced at over $200 can sell
: in significant numbers.

Well, 3DO managed to shift as many consoles as Atari even at the high
prices they were asking compared to the Jaguar. Marketting and consumer
confidence are the key here.

: BTW, I also predict that Atari's CD-ROM games for the PC, when
: released, will sell quite well.

Why? They can't possibly ever sell as 'well' as Jaguar cart games and
in comparison to 3DO, PSX and Saturn titles they will certainly be perceived
by softcos and stores as 'Poor' sellers.

All right, which queer posted this??? The Jaguar 2 ranks up their with the M2. EGM, the only-like the PSX magazine even said, "and the Jag 2, which the Q Mann tells you is quite cool." The Jaguar games are not nearly as blocky as Saturn games, thus far, let's wait to make a final judgement. The Jaguar/CD combo is more powerful then the 3DO, PSX, Saturn, and every other system. M2 and U64 will beat its power, but the Jag CD is out, and they are not.

2701. HELP: NVDI-Truecolor-Off-Screens???

Hallo! (Hi: English at the bottom!)

Ich hab eine Frage zu den Off-Screen-Treibern in NVDI: Wie bringt man den seit neustem vorhandenen True-Color-Off-Screen-Treiber "OFF16MOV.NOD" zum laufen?? Alle anderen Off-Screen-Treiber funktionieren problemlos (bis 32768 Farben). Ich habs mit allen Kombinationen von Format (Interleaved, Normal, Packed Pixels) und Pixelreihenfolge (Normal, Falcon, Intel) versucht, aber nichts hat geklappt. Als Plane-Anzahl hatte ich jeweils 24 und als Farbanzahl 16777216L angegeben. Was mache ich falsch?

Ueber Antwort wuerde ich mich sehr freuen, am besten bitte ueber e-mail!

- Mani -

Hi, I'll try it also in English: Does anybody know the correct use of the new truecolor offscreen driver "OFF16MOV.NOD" in NVDI? (NVDIMac) The others do work fine (up to 32768 colors), but i can't make the truecolor one work yet.
What are the correct work_in's?

Not in the U.S. Sega is wayyy behind, and 3DO is perhaps slightly
ahead. Sony will probably pass the Jag fairly quickly, but I doubt
they've done it yet. Maybe you should move to Japan.

Sony sold 100,000 PlayStations in two days! The Saturn has exceeded 100,000 in a four month time frame. Atari supposely sold 150,000 in 22 month time frame. Doesn't take a genius to figure out which one is the most popular!

Hey, it's good to know someone actually cares a little about the facts!

I recommend "GATES", another semi-authorised biography of Bill Gates (it's kind of insidiously written; not so much biased as based on interviews with a biased bunch of people with selective memory; but it does cover a lot of ground glossed over in "HARD DRIVE").

"WEST OF EDEN" and "INSANELY GREAT" are worth a look too.

Unfortunately, if Sega were to buy out Atari (which I highly doubt, but
anyway...), I doubt we'd see the Jaguar stay in production for too long.
Why? People are already on Sega's back for having too many systems (Genesis,
32X, CD, Game Gear, Saturn); adding another incompatible system to their
lineup wouldn't be a step in the right direction. The Jag would be too close
in price point to the Genesis, and Sega is clearly not ready to abandon the
Genesis (witness the portable Nomad unit that's now coming out).

Sorry, just had to butt in...

It would simply mean that Alpha was doing better fractals. If you ever
seen a fractal, you would know that the more iterations the better
(ditto for colors).

>Maybe so, but you can meet some friendly and exciting ladies with

Traditionally consoles sell best in the period from now til Xmas, theres
a falloff in sales after Xmas. You seem to be claiming that the Jaguar put on
50,00 sales in the slack 8 months from Xmas over summer, despite having sold
only 150,000 in the year and a bit before that. Its just a bit optimistic,
unless you have new figures to back it up.

: Besides, I wasn't making
: a point about popularity, I was pointing out that only the 3DO is
: currently ahead of the Jag AT THE CURRENT TIME. This means that the
: assertion that "all have blown away" the Jag is false for the time
: being.

Yeah, I wouldn't say the 3D0 has blown away the Jaguar but it does has
an advantage. Sega Saturn sales would appear to have been much more brisk
than Jaguar sales have ever been though, and the PSX has sold very well.

Man you are WAYYYY OFFFFF! Sega has already admitted that the 100,000
was sold to stores, not consumers, and that the actual number
(sell-through) is closer to 30,000. The Sony # sounds like b.s., too,
since I find it hard to believe that they have accurate sales figures
in less than a week. As for Atari, the number is over 200,000. The
150,000 sales figure is from January of '95. Besides, I wasn't making
a point about popularity, I was pointing out that only the 3DO is
currently ahead of the Jag AT THE CURRENT TIME. This means that the
assertion that "all have blown away" the Jag is false for the time

On the Jaguar I purchase a looooong time ago, the box has a
little sticker that brags "Made In USA". I've noticed that the new
$149 core systems lack this sticker. Why? If the old ones were
definitly made in N.C. by IBM, then it is possible that the new ones
are made in a foreign country, although still by IBM. This is just
speculation. If anyone has a new Jag core package (I know there are
a lot of you) then please post a follow-up to this post.

Distribution:

The Jaguar is still made in the US, though I'm not clear of IBM's
involvement. Atari also got Comptronix to build Jags in the US and
Phillips builds the Jag CD.

Nope...Sony stated that the 100,000 were sold to the consumers through their
tracking of sales. This was specificaly stated(Wall ST Journal - 9/12). I say
it is a sales blowout! Selling 100,000 in two days is indeed one. Sony's US
projected sales for the rest of the year is 700,000. Retailers state that Sony
could move 2 million!

I have an idea that if Sega were to buy out Atari, the Jaguar would definitely stay in production. If they begin to feel the problems of having a $400 machine, they need a healthy user base, and by adding the Jaguar they have another 200,000+ users to one of their systems. It would cost them about 300 million dollars for Atari, and I don't think they would want to pay that much to just get rid of Atari. But hey, one less copetitor might be good for them. Who knows? I'd rather have Atari stay alone, without Sega, but Sega reportedly owns 7.4% of Atari, from those infamous patents. See ya.

2724. B.Ware Software is Dead

Newsgroup: comp.sys.atari.advocacy
Date: 1995-09-19 00:00:00 UTC
From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <519451886wnr@dwell.demon.co.uk>
Source record: 11379

B.Ware Software is Dead.

B.Bytes Computer Systems and B.Ware Software of 19 Southfield Road, Hinckley, Leicestershire, LE10 1UA, UK. has officially closed.

Unfortunately the little income from Shareware Registrations was insufficient to cover the bank charges and persistent overdraft.

New Arrangements for Registration and Support of Super Card 3 will be announced shortly. Please don't try to register via B.Ware for the time being as the bank account is closed.

A new version of Super Card and a lower Registration fee are promised.

It is likely that users who Registered over 12 months ago will be given the option to re-register for a small fee - Possible Five Pounds, should they want any further assistance or later versions of the program.

We hope that you consider this to be fair.

Any moneys received will be used to help pay off our creditors.

Ownership of all other B.Ware software titles will revert back to their original authors to do with what they want.

Some B.Ware titles will be released as Public Domain that were formally Shareware.

This in no way effects Lottery Companion 2 by Mark Butler.

Thank you for your interest.

Mark Butler and Chris Beale.

I'm a strong old-time Atari fan, but I can't help but to think that the Playstation is going to dominate. Sony is huge; they have incredible advertising. THe kids are excited to try the new SONY name, and all the advertising is why. I don't think even the Saturn can dominate over Playstation. Nintendo Ultra-64? Forget it - Nintendo finally dropped the ball in making it so late. **ALL** the kids want Playstations - from what I have seen - although it may not be a representative sample of the population.

A Jag needs a CD to equal a Playstation, and it's not really cheaper when you buy the controller and the CD - although "for a limited time" get a free controller with a Jag.

I've heard of all the shitloads of games promised by Sony, slated to be available by Christmas. After all the broken Atari promises for games, I have difficulty believing ANY game maker's claims that they'll have X number of games by such-and-such date. However, it wouldn't surprise me if Sony comes a hell of a lot closer to meeting their promises than Atari....

: But you believe Atari, but not Sony and Sega.

Atari is a US company bound by US laws. Sony and Sega are
Japanese and can exagerate. Why do you think Panasonic's 3DO sales figure
is so much higher than the 3DO company's figure? The 3DO consortiom gets
royalties for each machine and disc sold.

If anyone is on a Jihad it would be you. It looks as if you've made it
your mission in life to convert all those poor misguided Jaguar owners.
Well, good luck! Maybe one day you'll finally convince them that all those
Jag games really did suck and they will go out and find nirvana with Sony
and the PS (But wait! Some of the Jag owners might have the PS too! Well
perhaps you can try to convince them that all those hours they *thought*
they were having fun playing T2K were only an illusion!). In case you've
got some extra time on your hands here are some ideas for more crusades:
1. Go to the alt.pet.dog folder and let those chihuahua owners know that
Rotweillers and Pitbulls rule! After all we know who would win that fight!
Those silly chihuahua owners!
2. Go to the alt.auto.vwbug folder and let 'er rip!
3. Go to the get.a.life folder and tell them that they need to be just
like you!

: I'm a strong old-time Atari fan, but I can't help but to think that the
: Playstation is going to dominate. Sony is huge; they have incredible
: advertising. THe kids are excited to try the new SONY name, and all the
: advertising is why.

I'm thinking the same. The "domination" effect gets exagerated
though. Some people assume that Sony, being a 36 billion dollar company,
is going to drop all of their other product lines and pump everything
into the PSX. That of course, won't happen. They'll certainly give
Nintendo and Sega a good shake.

I don't think even the Saturn can dominate over
: Playstation.

I think it will be a neck and neck fight, much like the SNES vs.
Genny battle. The Saturn also has a lot of support and Sega's muscle
behind it.

Nintendo Ultra-64? Forget it - Nintendo finally dropped
: the ball in making it so late.

I agree. 1) The U64 is late. 2) The Super NES isn't old. 3) The
specs published for that machine are amusing. Example? The U64 is
supposed to run at 500 megahertz. My question? Who in this group has a
computer that runs that fast? Half that fast? A quarter that fast? If you
do, how much did it cost you? My bet is that you payed a whole lot more
than $250. Nintendo is the most unninovative company when it comes to
hardware.

: A Jag needs a CD to equal a Playstation, and it's not really cheaper when
: you buy the controller and the CD - although "for a limited time" get a
: free controller with a Jag.

The PSX has some hardware perks over the Jag, even with the
CD-ROM. The Jag is certainly a decent machine, but not the top of the
line in hardware anymore. Having said that,

In Canada, the Jag is $200 and the Jag CD is $200. That's $400,
including the system, a controller (two if you buy now), a CD-ROM and two
games. The PSX is $430 with one controller and no games. There still is a
bit of a difference. The fact that kids can by one component now, save
up, and then buy the other half is another point in the Jag's favour.
Most people will look at a $400 console and say "That's too expensive."

: I've heard of all the shitloads of games promised by Sony, slated to be
: available by Christmas. After all the broken Atari promises for games, I
: have difficulty believing ANY game maker's claims that they'll have X

: number of games by such-and-such date. However, it wouldn't surprise me
: if Sony comes a hell of a lot closer to meeting their promises than Atari....

Definitely. The Jag's biggest problem has been Sam Tramiel. The
machine is good and Atari Corp did some good work trying to rebuild from
the ashes of the Lynx and 7800 fiascos. WHat hurt them was Sam telling
customers that X number of games would be available at X time. We all
know that software is delayed in development for anyu system. The trouble
is that other companies don't give release dates until the product is
virtually ready to go.

As for Sony, they've already started. They initially promised
forty games at the time of launch. There are only one quarter that many.
Still better than Atari, of course. Delays sure aren't Atari's monopoly
though.

Hey, Sindork! Have you checked the stores in your area lately?
Software Etc. in your area should be carrying the Jaguar now, and your
local Wal Mart might be carrying it soon, too. I just can't wait until
the Jaguar appears in your neck of the woods. You'll probably commit
suicide because you'd be so disgusted with it.

> Atari's worldwide sales in the last
>quarter was $3 million.

Technically, $4.5 million. I know you try to belittle Atari with every
chance you get, but stick to the facts. And remember that Atari's
4Q 1994 revenues (sales not including Sega money) was $16 million, up
77%.

> The Tramiels have taken a $500 million annual firm to
>the bottom..

Actually, the company was taking in over $700 million annually in the
early 80's (when the 2600 and arcades were at their height).

And from the looks of things, the Tramiels aren't really in charge
anymore. Ted Hoff is running a big part of the ship.

Hmmm... Nintendo must have a better engineering team than DEC does.
As far as I know, the fastest processor is the Alpha, which must
be reaching the 300MHz mark, cause I know they're shipping 275MHz
machines. Of course, these machines costs $40,000 :-)

>software libraries of its budget competitors.

Price advantage is nothing!? what the hell are you smoking? If the
PlayStation's price was reduced to $249, you'd be all over this group
proclaiming the value of the PSx vs. the Jag.

Pricing is a big factor in the eyes of many consumers. The lower
price of the Jaguar makes it an attractive entry-point for people
who want next-generation but don't want to pay the big $$$ to
get into it.

>: I am
>: still unconvinced that gaming systems priced at over $200 can sell
>: in significant numbers.

> Well, 3DO managed to shift as many consoles as Atari even at the high
>prices they were asking compared to the Jaguar. Marketting and consumer
>confidence are the key here.

That's still not significant numbers. And marketing/distribution played
a big role here. If Atari's marketing/distribution were the size of
3DO's (it might be that way soon), then we can make real comparisons
on the sales. And I really think that the Jaguar could sell very
well with a highly visible market presence.

[Atari's PC software might sell quite well]

> Why? They can't possibly ever sell as 'well' as Jaguar cart games and
>in comparison to 3DO, PSX and Saturn titles they will certainly be perceived
>by softcos and stores as 'Poor' sellers.

What!? Atari's PC software will be available to 40 million home
computer owners. It's not limited to Jaguar owners. It will be in
software displays with the rest of the computer software.

For example, if Atari gets PC Tempest 2000 out this Christmas
season in a large number of software retailers, they could easily
sell 200,000 copies.

And Super Card remembers sending you an 8-Bit catalogue in August 1989 !

Assuming you are the same person.

Although B.Ware is closed due to the fact that it for some time now it hasn't been able to keep up with the bank charges, I am still around and have already put out the very popular Lottery Companion program.

I am already working on a new version of Super Card which will be put out to help pay off all the remining debts, "Debt Ware" ? - And hope to team up with other programmers to write a major update over the next six or so months.

If any one wants to talk about B.Ware's demise then feel free to Mail Me.

I'll be back !!!

Mark Butler, Atari 16/32 Shareware Programmer.

>> suicide because you'd be so disgusted with it.

>Nope..Checked today. The Cedar Falls Wal-Mart has the PlayStation with 16
>titles! No Jagflop in sight..

Of course there's no Jagflop in sight, Idiot! There's no such
product as a "Jagflop"!

Take another look at your local Wal Mart in mid-October. Chances
are the "Jaguar" just might be there.

>> And from the looks of things, the Tramiels aren't really in charge
>> anymore. Ted Hoff is running a big part of the ship.

>Ted Hoff may stem the hemorging, but the Jagflop ain't going anywere,
>GET OVER IT!

You GET OVER IT! Despite what you think and say, people enjoy their
Jaguars. Despite what you think, Atari WILL have a good fall season this
year if the distribution actually happens (They've already made $4 million
in revenues from JagCD preorders alone).

And none of your naysaying and pathetic spewing is going to change this.

I can't find the original posting, but someone claimed that MIDI ports were available for clone computers on "any sound card". I've just completed a check of all sound-card equipped clones at work, and while they *do* have "line in" and "line out", they do not have MIDI.

All SoundBlaster and SB clones have built-in MIDI... it's just that
it costs extra to use it :-) You purchace a dongle-like thingy that
plugs into the joystick port, and it gives you MIDI in and out.
It may also give you a port thru so you can still use your joystick.

There are plans on the net for building your own interface tho.

And finally, if you REALLY want MIDI, you purchase anything BUT the
SoundBlaster and clones. Something like Ensoniq, which I think has
standard MIDI ports...

In order to squelch this debate, I asked my broker from ML (I know...I
don't let him churn me, I give him the orders). And he told me for what
it's worth: that even if a Japanese company trades it derivitives in our
markets, only the Anual report must conform to SEC/GAAP guidelines.
Otherwise they can pretty much say what they want. My guess is that the
PSX has probably sold alright, but I don't really care, I diden't buy one.

Two Years Ago: "Daddy daddy, I want a DUO, it's only $300"
One Year Ago: "Daddy daddy, I want a 3DO, it's only $300"
Today:"Daddy Daddy, I want a PSX, it's only $300"

DUO,3DO,PSX. hmmm.

You are really full of yourself. All 250 pounds of yourself.

2751. Hey Sinflop- What about Pippin?

Newsgroup: comp.sys.atari.advocacy
Date: 1995-09-23 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950923154554.17237C-100000@PEAK.ORG>
Source record: 11306

With all the anti-Jaguar spouting, I can't help but think back to when Sinflop was "pro-Pippin" a few months ago.

I've played the Playstation and I agree that (regardless of how many bits it is or of the actual specs) it plays fantastic games. However, why is Sinflop so pro-Playstation and not pro-Pippin?

Apple would have to be a fool to enter this already overcrowded market. I've been looking at "The Incredible Universe" outside of Portland - an amazing electronics/gizmo store. Fortunately, they still have a nice Jaguar display, with 2 Jags on their own monitors and one big-screen with all the systems hooked up (SNES, Genesis, 3DO, Jag (etc)) so there are 3 of 'em. After being gone to the Great White North for 3 months, I was still slightly disappointed to see that there weren't a whole bunch of Jag games and NO CD on display. I'll have to admit that. However, where is the Pippin going to be?

I noticed that the Phillips CD-I units were moved to the BACK and do not appear to be fast movers. I wouldn't be surprised if they are on their way out shortly. Fortunately the Jag doesn't appear to be.

THere was also a "Neo Geo" system with (apparently) fewer games than the Jag and for about $400 or more.... What a joke. Do people actually buy these things?

James

2752. Wal-Mart stocks the Playstation and 16 titles!

Incredible, simply incredible. It's more like: "Why should I pay more
for a product that is Hyped more than this product which isn't Hyped
but which has true quality?"

Compare it to: "Why should I pay more for Win95 which is still a 16 bit
OS when I can get a true 32-bit OS with OS/2 or Unix?"

Nay. Sony is traded in the U.S. via ADR's on the New York Stock Exchange. They have to meet the listing requirements of the NYSE, but these requirements are not at all the same as the financial disclosures that publicly traded U.S. corporations are required by law to make.

> Sinflop so pro-Playstation and not pro-Pippin?
>

Well, Pippin is not out yet. Apparently Apple blew it with the pippin by reasigning the engineers to more promising projects. The pippin will be out in Japan soon and the U.S. by April 96. I believe Apple will market the PowerPlayer as a WEB surfer console.

> Apple would have to be a fool to enter this already overcrowded market.

>

Apple would be foolish to market the Pippin as a games console. However, there is a need for a low cost high powered net console.

> I noticed that the Phillips CD-I units were moved to the BACK and do not

Ie, Ie, I agree with these two, we can join forces, if all (or most) of the home computer/video game manufactures got together and adopted the Toas as a standard operating system, we could beat the c--- out of MicroSoft and Intel, while keeping our old O/S's and our own custom hardware, because Toas is meant to keep the programming model from being dependant on the hardware (including processor instruction set). This allows our machines to access a common pool of software (that would be capatible with many machines including PC's), this would create a big market to write for. A company like Novell, (long time rival to MicroSoft), would most likely be very interested in a product like Toas.

Pete,
The Mac is refurbished for one thing. How bout prices on new
Macs? Secondly, my Falcon gives me 16-bit color and 16-bit
stereo. No advantages there. Quite a few people, I believe,
wouldn't be able to use ethernet (some colleges allow this).
You get more memory and hard drive space but, hey, you need it!
I have an 85 meg hard drive on my Falcon and have almost 20 megs
free. You do get a CD-ROM drive.
Of course, you could buy a used Falcon for less.... and the
price advantage of any Mac flies out the window when you add the
cost of high-priced Mac software.
The bottom line is that a Falcon is much more fun to us!!
Oh, I saw that my local Mac reseller was selling a box that allows
a Mac to hook up to televisions for presentations. Standard on
my Falcon ;-).
-scott tirrell
BTW, I was looking in Mac World and hardly any advertisers had systems
to sell. Noone had new machines at prices around $1,000....

Ethernet makes for a great high-speed printer port.

Maybe programs take more space on a mac but data should be the same.
Graphics files at a given resolution and bit depth are just as big
on an Atari. And MPEGs don't magically shrink when you bring them to
Atari.

The refurbished Macs = buyer remorse and or failed Apple's first burn in process but sent back to the repair line to fix the glich but can't sell as new. Backed by a 90 day warranty. Lots of people use ethernet and you are deluding yourself if not having it is not important. Schools need ethernet..Looks like a missed oppurtunity for Atari.

I have a 250 meg HD with 60 megs of free space. I may have more items than you do. Lots of quick art..

> Of course, you could buy a used Falcon for less.... and the
> price advantage of any Mac flies out the window when you add the
> cost of high-priced Mac software.

You can buy a mew Mac LC 475 for $499 with a one year warranty from Mac mall and MacWarehouse. What high priced Mac software? Elaborate with real world home/business apps, please.

> The bottom line is that a Falcon is much more fun to us!!
> Oh, I saw that my local Mac reseller was selling a box that allows

The Mac is also fun to use especially with the standard cdrom unit.

> -scott tirrell
> BTW, I was looking in Mac World and hardly any advertisers had systems
> to sell. Noone had new machines at prices around $1,000....

Mac Mall, Mac Zone and MacWarehouse has Performa 636 8/250/cd with keyboard and software bundle for $999. Leftover Powerbook 150's are priced at $999. Much cheaper and useful than the mythical over priced ST Book.

I am an Atari owner. Yes, Nintendo has delayed the U64. However, Nintendo has
continously released titles with marketing and continous distribution. Atari's
products have been delayed when dates have been put in stone.

I suspect Nintendo's successful Christmas strategy is: who needs Next Gen...

Yes, Nintendo has delayed the U64. In the meantime, titles continue to be released at a rapid pace on the SNES. Sony never said that forty PSX games would be released at launch. I heard forty - fifty by Christmas. I count 16 titles now at Wal-Mart and Software Etc. As for the Sega Genesis modem, thats one product. While every Atari product under the Tramiel regime has been delayed by weeks and months - year as well. Nice try!

Yup, I had real fun with the Quadra 950 I just added to my
collection. I will have to say they have excellent service.
Purchased it from BigMac, saw the add in Mac User. Plugged
it in and no video. Fuck. Should of worked hooked to the
NEC XP 21" I just got. So I called Jack, err a, Mac, and
they asked, "did you turn the key?". Yup I says. Ok we will
send someone right out to fix it. Two day's later a Kodak
repair man shows up with a new 950 logic board. Wow, nice
I thought. He fumbles with the covers and finally sets it in
place. Power up. No video. Shit. Ok he says, I'll come back
tomorrow with a new logic board and a new power supply.
The guy actually shows up, replaces both items and shazzam,
it works. Ok, I bought 7.5 on CD, but had to boot off a floppy
first. (Bought it with no hard drive so it would fit on a
government credit card, 2500.00 limit you know). Message,
this disk is unreadable, do you want to initialize it?
Hell no, its my new disk tools disk, why in the hell would I
want to do that? Checked connections. They look ok, but the
cable had been folded in about six places, one area with wire
showing through. Ummm... Yanked the external HD drive off the
Quadra 630, fired it up on the 950 and it actually booted.
Ok, great. Now I can format the Quantum 540 I stuck in the
950 (I removed it from my Toad 4-bay, it "was" Atari formatted).
Run SCSI probe. Yup, its there. Run the Mac HD software to format
540. What, it's not there? Son-of-a-bitch (ehh..SinPlop?) I
know it's there. Call Jack again. Wait 30 minutes (better than
microstuff). Wha, Wha, Bla,Bla. Oh! If it's not Mac formatted
the Mac Software can't "see" it. What? A HD has to be Mac
formatted to be able to format it? Which came first, the chicken
or the Mac? You know, I forgot how the hell I finally got it
formatted, but it is. Ok floppy dosen't work, so transfered files
from 630 disk to 950 internal. Stuck external back on 630 and
loaded Crystal CD software it, put back on 950. Hooked up
CD and 630 HD (still following?). Wow, 7.5 loaded ok. Went from
1.3 megs of system software to 2.4, but what the hell, I have 32.
XP21 was actually to damn big for my station, swapped for an
Impressions 17". Shit, what's all that green. Umm.... Seems
the 950 needs a switch on the monitor port (al la multi-sync
gizzmo) to tell it what to sync on and what screen size to use.
Call Mac Zone. Ordered 1 meg of V-ram and a Lappis switch. It

was only about a 100.00, what the hell. Mean while, back at the ranch, I went to the local Jack dealer. Needed a floppy disk ribbon cable for a 950. Guy comes back with a power cable. Umm.... No, I need the wide, flat, gray, cable about 15" long. Guy comes back with 15 4 inch cables. I smile and go home to my Falcon. I can make the disk cable up, I'm sure, or have the Kodak guy bring it out, but he will have to install it. Mac Zone order should come in Monday. <Hope> that fixes the monitor problem. Now look at a DiiMO Cache add in Mac Abuser or Mac World. Read the add close. It says a 50mhz 040 with 128k cache for Quadra 610,630,650.660AV,700,800,900,950,ect.. others shipping soon. The only reason for the 950 was to add this card so MagicC Mac would rip-ass. Ordered from Mac Zone. Asked for a bla,bla, for a Quadra 950. Yup, we gottum. 828.00 Now I gottum. Easy installation. Pull old (new) 040 out and add DiiMo. Smoke! Called Peripheral Outlet. hey, your add says bla,bla (read above). No, No, that add was ment for our future products. We only make the 50mhz for a 700 and 900. I says, Lady read your fucking add. I'm sorry sir, you'll have to take that up with advertising. Now what? Called Mac Zone. Hey, you guys sold me a product that just smoked my 950. (Told them what DiiMo bitch said). Ummm.. our data says it works on a 950, well change that right away. As for you 950..... Called Jack again. It's broke. Did you turn the key? Yup. Ok here comes the Kodak guy. New logic board at no cost. Thats service. You know I got rid of a Pentium 90 with VLB video problems for this. Mabey, after this next job i'll make enough to order a 900 logic board. With the V-ram, DiiMo 050mhz and MagicC Mac, i'll end up with a nice machine. But the 33/040 is slower than my 486/66 at home buy a ways (I don't care what the specs say) and dosen't even compair to the Pentium. In the mean time I brought my Falcon into work (image that, an Atari an a Naval base) to complete the job. I had 120 scanned Tiff's that were to be incorperated into a document. That really took some space and would take forever to print so I let ImageCopy 4 batch process them to JPG's. Then, printed them to an HPLJ4 (you should of seen the little Falcon run the 21" without any problems). I knew I should of ordered the Medusa 060 for work!
It just goes to show you SinDrop err...SinPlop, nothing is perfect, not even your Jacks. And the slow little Falcon got the mission done. (Its now back in its nest at home:))

I just read a recent issue of Time Magazine and they have an article about Apple's falling fortunes in the market!

Let's see, they mention that Apple's CEO might be going the way of John Scully. They also mention that Apple's recent earnings are going to be MUCH LOWER than expected. Also mentioned is the potential impact of Windows 95 on the Mac market.

By the way, Apples' market share has DECREASED from 13% to 8% and is expected to slide down to around 5% by the end of the decade. Your niche is getting smaller, Sinflop!

/Kevin

P.S. Too bad Sindork is a Mac advocate, I really liked the system until I found out about Sinflop here.

Pete,
16 bit sound on a Mac doesn't mean the same thing as Falcon
Sound! I can do 16 channels of 48KHZ playback direct to and from a
SCSI-II hard disk! This cannot be done with a Mac without special add on
cards and even those won't ever get you to 16 channels running Cubase
Audio on a MAC. I can do that with a Stock Falcon, 4meg 65meg HD and a
Syquest SCSI drive. It is also true that Falcon software is much more
compact as a general rule than Mac software, but still quite functional
and in the case of d2d digital music recording, much more functional. In
fact there is no alternative to a Falcon for Music and general purpose
home computer use in one Full Multimedia machine with everyhing standard!
Falcon's rather unimpressive 16 MHZ 030 is counter balanced by the
Falcon's multi-processor architecture allowing many things that are only
available through a limited number of add-on cards on other machines,
thus cannot be generally supported. I.E. Blitter, DSP etc.
All the Falcon needs is a ton of game cartridges and a CD rom
marketed for video games and you could put them in as an alternative to
the 32BIT playstation, which can only play Video Games, where as the 32
bit Falcon can do anything a Home computer can be asked to do. Ok, the
Sony P/S hardware is in a different realm entirely, there, now you don't
have to flame me, but I Love my Falcon, it's everything I need it to be
and more. (I'm touching it now! *sick*) Anyway, Stik saved me from
looking into an AMIGA to do WWW on anything but a PC and I don't have $
for a MAC.
:) Paul.Luscher@m.cc.utah.edu

Het leven is een eigenaardige verzameling van alles buitengewoon!
Methought, Hence Mewert!

[snip]

It's nice that the Falcon has those "other things" but there is no
"counter-balancing" for Atari's laziness in throwing in a lowly 16Mhz
processor to start with. 16Mhz machines should have died out in the 1980's.

> All the Falcon needs is a ton of game cartridges and a CD rom
> marketed for video games and you could put them in as an alternative to

Heh heh heh. These are the things that the Jaguar needs, actually.
Might as well forget about it for the Falcon, beause it will never happen
so it's not worth discussing. Trouble is, it's beginning to look like it
will never happen for the Jaguar if Atari doesn't get their asses in gear.
Don't get me wrong; I WANT this to happen but my patience wore thin after
the Jag was about 2 years old.....

James

In comp.sys.atari.advocacy you write:

> 16 bit sound on a Mac doesn't mean the same thing as Falcon
>Sound! I can do 16 channels of 48KHZ playback direct to and from a
>SCSI-II hard disk! This cannot be done with a Mac without special add on
>cards.

Well, only the 68K AV macs can do 48KHz sound, the rest can only do
44KHz or 22KHz of actual sound since it's gradiated by 1/2 Hz. But
that is still above the exceptional mark for human hearing. And
middle aged people are lucky to hear 16.5KHz. The mac can do
44KHz playback @ 16-bit from a SCSI harddisk. I've done so using
32 channels. Couldn't the Mac version of Cubase just suck?

>Falcon's rather unimpressive 16 MHZ 030 is counter balanced by the
>Falcon's multi-processor architecture allowing many things that are only
>available through a limited number of add-on cards on other machines,
>thus cannot be generally supported. I.E. Blitter, DSP etc.

There is a difference between a multiprocessor architecture and using a
few ASICs. All computers use ASICs but few can manage, in an effective
way, multiple processors.

The entire industry has boomed, dork. Just because Apple's sales have
increased doesn't mean that they're keeping up with the competition.
From the looks of things, they're not.

>> By the way, Apples' market share has DECREASED from 13% to 8% and
>> is expected to slide down to around 5% by the end of the decade.
>> Your niche is getting smaller, Sinflop!

>I heard that in the last 10 ten years.

And it's true, is't it? Let's see, their market share has gone from
15% to 13% to 8% and now projected to 5% by the end of the decade.
They're getting squeezed into a smaller and smaller niche.

>My school has ordered lot of Powermacs. Looks like Apple is redirecting their
>scarce stocks to the education market.

And they're abandoning the rest of the market in the process.
How effective is it to teach a child how to use a Mac when he/she
will step outside of school and discover it's nowhere to be found?

>Jag...the couch potato of the console world.

Hate to break this to you, Sindork, but Atari doesn't compete with
Apple anymore. It's all over. Atari lost their bid for marketshare
in the computer industry and it looks like Apple will be the next casualty.
GET OVER IT!

Believe it or don't...but Newsweek is bigtime into the Web and covering
the "Information Superhighway". They have a weekly page covering hot
topics and publish their reporters' email addresses as part of the byline on
many articles.
The weekly (hardcopy) page is "Cyberscope".
The magazine letters column email address is "letters@newsweek.com",
or "newi50a@prodigy.com".
Do a Yahoo on "newsweek" and you'll find the Webpage.

How has Atari's image been reborn? I haven't seen mention of it anywhere. Except here, of course.

I'd like to see the report concerning those laptops that "burst into flames." Surely they'd be mentioned in the Mac magazines, especially MacWorld, which doesn't hesitate to point out Apple's flaws when necessary. (Also, does Atari make laptops anymore?)

And, if Atari's management is so exceptional, why is it only a tiny little niche, the way it was when I finally gave up on it a year ago? A logical explanation would be fine...I know how Atari users can go off half-cocked and start sputtering out insults. I used to do it myself! :-)

Yeah - totally unfair - unfair to Works. Papyrus is just a word processor. I forgot to mention that Works has spreadsheet, and database. I never use anything but the word processor, so I can't attest to the quality of those components, but they are there if I need them.

However, "Microsoft Word" is available at the college bookstore for $99 - "educationally priced." Don't worry if you're not a college student or faculty member - I'm sure most anyone would buy it for you. The point is that I *can* get Word (full-blown version) for $99, and back when I was looking for a hot WP for my Atari, I found that Papayrus cost more than the hardware on which it was to be run.

My point was simply to counter the accusation that Mac software is "expensive" as someone tried to claim. My point was simply that Atari software is expensive, probably more so.

I don't know what the original release date was, nor do I give a sh*t.
It won't be long before it is, and my point still stands - the same
problem (few games) plagues it, as it has from day one. You need not
dwell on the fact that it's not exactly 2 years old in an attempt to
defend a situation (game shortage) that should not be.

Still quoting hardware quantities and ignoring overall performance, the
incredibly tenacious Peter Sinclair-Day (sinclap2954@cobra.uni.edu) wrote:

: My Performa 636 8/250/cdrom, keyboard, software bundle,
: built in communications/video slots plus the top of the line 040-33 mhz
: costed $999 plus $3.00 for next day delivery from MacWarehouse.

Since we know that Apple's inefficient operating system can make a
16 MHz 68030 computer (the LC II) run slower than Atari's 8 MHz 68000
computer, it's obvious that your 636 wouldn't be able to keep up with
the Falcon.

It's no wonder the 636 is so cheap.

Eh? Unsafe and inefficient platform compared to Atari's design. Wasn't aware that Atari made 040 and PPC machines. You cannot compare Apple's mgt to Atari's one. Apple's mgt has grown the company with annual revenue growth rate by at least 1.5 billion and profits are stable. There was problems with the lithium batteries. Apple switched back to the old ones and resumed shipment last week.

Every corporation's have had departures by top executives. IBM recently lost their CFO. Apple's CFO lasted 10 years. He lost out in a power struggle. I understand that IBM's Gerstner is difficult to get a long with.

>that is still above the exceptional mark for human hearing. And
>middle aged people are lucky to hear 16.5KHz. The mac can do

To create 16.5KHz of real sound you need at least 2*16.5=33KHz of
sample frequency - but so more so better.

B.Ware Closure - Further Information for users and suppliers of B.Ware software.

If you distribute B.Ware Software then please include the following text
as a file on any discs sent out so that your Customers are aware of the new
arrangements.

Following the official closure of B.Ware Software, Super Card 3 will now be
supported exclusively by Mr Chris Beale.

Any enquires can be made by writing to Chris Beale at 19 Southfield Road,
Hinckley, Leics. LE10 1UA or by phoning UK 01455 613377 most evenings.

Registration of Super Card 3 is Ten Pounds with an Eight pound option for
users who include their own Disc and S.A.E.

Full manual included on disc.

Payments accepted by Cheque or Postal Order made payable to C. Beale.

For a copy of the latest version send a Disc and S.A.E. to the above address.

Thank you for your time.

2854. Re: Apple Flambe

Newsgroup: comp.sys.atari.advocacy
Date: 1995-10-07 00:00:00 UTC
From: dferran@crash.cts.com
Message-ID: <455542$25g@news2.cts.com>
Source record: 11209

The one and only Peter Sinclair-Day (sinclap2954@cobra.uni.edu) responded promptly and fairly with:

: In article <451pb3$idb@news2.cts.com>, dferran@crash.cts.com
: (George Crissman - Ferran Scientific) writes:
: > Leave it to Apple Computer to make Atari look good: first by
: > providing an unsafe and inefficient platform when compared to
: > Atari's design, and second in the application of management that
: > is ineffective compared to the management style used at Atari.

: Eh? Unsafe and inefficient platform compared to Atari's design.
: Wasn't aware that Atari made 040 and PPC machines.

Technically true, Atari is no longer making computers. But knowing that a 16 MHz 68030 system from Apple (the LC II) runs slower than an 8 MHz 68000 system from Atari (the 520 ST), it's pretty clear that Apple needs '040 and PPC architectures to keep up with the Atari-designed 16 MHz 68030 Falcon system. [There, I think I lined all the ducks up right, that time!]

: You cannot compare Apple's mgt to Atari's one.

Of course I can!

: Apple's mgt has grown the company with annual revenue growth rate
: by at least 1.5 billion and profits are stable.

What they've done in the past with respect to nourishing a company so it will grow is laudable. But the current management is "...stung by shortages of crucial parts, a continuing inability to accurately forecast sales, and even a quality-control problem that has caused some of it's laptops to burst into flames."

More to the point is speculation by "...several analysts..." that Apple's Board of Directors has given CEO Spindler six months to regain control of the company, or else he gets his walking papers, too.

: There were problems with the lithium batteries. Apple switched back
: to the old ones and resumed shipment last week.

Good news!

: Every corporation has had departures by top executives. IBM recently lost
: their CFO. Apple's CFO lasted 10 years. He lost out in a power
: struggle. I understand that IBM's Gerstner is difficult to get
: along with.

Are you suggesting that management chaos and a company culture that rewards people who refuse to work together is good for business these days?

Spork (spork@primenet.com) wrote:
: In article <451pb3$idb@news2.cts.com>, dferran@crash.cts.com (George
: Crissman - Ferran Scientific) wrote:

: >Leave it to Apple Computer to make Atari look good: first by
: >providing an unsafe and inefficient platform when compared to
: >Atari's design, and second in the application of management that
: >is ineffective compared to the management style used at Atari.

: How has Atari's image been reborn? I haven't seen mention of it
: anywhere. Except here, of course.

The news report clearly described a management in chaos, with the CEO effectively playing "King Of The Hill" and pushing the Seconds-in-Command out. That makes Atari's management look pretty good by comparison.

: I'd like to see the report concerning those laptops that "burst into
: flames." Surely they'd be mentioned in the Mac magazines, especially
: MacWorld, which doesn't hesitate to point out Apple's flaws when
: necessary. (Also, does Atari make laptops anymore?)

The source was quoted in the original posting: The New York Times News Service, as it appeared in the business section of the San Diego Union Tribune on Thursday, October 5, 1995.

Identification of the source of the laptop conflagration is in Peter Sinclair-Day's posting, right here in this very thread!

: (Also, does Atari make laptops anymore?)

I think both the STacy and the ST Book are out of production, although you *might* still be able to pick one up if you know where to look. The ST Pad never saw the light of day, unfortunately.

: And, if Atari's management is so exceptional, why is it only a tiny little
: niche, the way it was when I finally gave up on it a year ago?

Now you're putting words in my mouth. I didn't say Atari's management was exceptional ... although they *are* showing great improvement! What I said was that Apple Management was making Atari Management look good.

: A logical explanation would be fine...

Here in *.advocacy? Just as I was perfecting a suitable argumentative style? [Sulks Quietly For A Moment]

: I know how Atari users can go off half-cocked and start sputtering
: out insults. I used to do it myself! :-)

I do this for the mental challenge and the fun. Personal attacks
and insults not only destroy the mood of the discussion, but they
can obscure some otherwise fine points made on both sides.

I first touched a 400. it wasn't as powerful as the Apple II's at school, but cooler. Then an 800. Then I bought my 130XE. Man, I loved that thing. I kicked my commodore and Trash-80 CoCo friends' asses. High school rolled around, the XE became my game machine. I met girls, forgot about computers. Came to college, girls wouldn't talk to a freshman guy. Spent a lot of time in the library. Found the computer lab. No Atari's. Bummer. But they did have some old macs. Pretty cool. Moved off-campus - housemate had a LCII mac. Cooler. He ordered a PowerMac 8100. The coolest! I ordered my powermac, now I rule. My XE still plays hardball and boulderdash once and a while, but the mac reigns supreme in my (computer) life.

Why this cute short story full of sentence fragments? Because I just popped in on the newsgroup out of curiousity, and I can't decide if all of this interest in Atari is heartwarming or ridiculous. At least you people aren't as evangalistic as Amiga-people.

Sure they do, but yet Ataris are widespread e.g. in the Techno scene (not
to mention that Jean-Michel Jarre uses Ataris).

>If the Falcon is soo great, why is it's role miniscule?

Tunnel vision, I presume.

>How much did
>your falcon cost?

Falcon MK II, internal 350 meg SCSI, 14 megs, Cubase Audio: 4,090.- DMs,
compare it with the price of the Session 8/Cubase Audio bundle.

>Can you run Quicktime
>annimation and wealth of multimedia software?

What use do these have for a musician?

I don't understand what you mean here. Are you implying that you can't
record sounds directly to the harddisk on a PPC? That's completely
untrue.

>What use do these have for a musician?

Actually QT could be fairly handy for a musician. QT has platform independant
(as long as you platform is a Mac or PC :)) MIDI support. It also offers
a variety of compression formats.

Christ Almighty. The entire point here is that a program like Papyrus
for the Atari cost more than the hardware on which it is to run. THE
ONLY REASON IT WAS BROUGHT UP WAS BECAUSE AN ATARI USER ACCUSED OTHER
PLATFORMS OF HAVING "EXPENSIVE HARDWARE."

In the meantime, people have resorted to refusing to acknowledge that
PC/Mac versions of software comparable to (if not superior to) Papyrus is
available for a fraction of the price. I'VE SEEN IT AT THE COLLEGE
BOOKSTORES!!! I don't know how anyone can have any face when they deny
this fact. The fact that some business pays $239, or even a GOVERNMENT
AGENCY (didn't the U.S. GOv't pay $500 for toilet seats some years ago??)
for that matter lacks the resources to pick up products at the lowest
prices IN NO WAY invalidates the fact that they are available for less
elsewhere.

Please....I'm just trying to stick with the facts here. I suggest that
the nay-sayers do the same. I can get the latest version of "Microsoft
Word" for $99 at the school bookstore. Anyone care to post the price of
Papyrus (even mail order from Toad) so I can prove my point and lay this
arguement to rest?

James

He was not the second in command. He was a bean counter. Atari's chaotic mangement drove the company into the ground, you know taking a $500 million firm and tanking it to $28 million last year. There not done yet. Apple's chaotic mangement has grown the company by at leat 1.5 billion annual with billions in the bank.

IBM's Gerstner drove out his second in command..

Kevin Haley (khaley@nova.gmi.edu) wrote:

: Atari sold 150,000 Jaguars as of January 1995. The current base is
: estimated at 250,000+ by most newspapers and analysts. In fact,
: one industry analyst speculated that the Jaguar userbase could get as high
: as 450,000 after this Christmas.

When I stopped in at Incredible Universe! (division of Tandy Corp, the
people who also brought you Radio Shack) I noticed Tempest 2000 running
on a big-screen TV and a *hefty* stereo system (including massive subwoofer!)
facing directly into the main hallway where it could be seen (and heard!)
by everyone. Try as I might, I was unable to fight my way through the crowd
to get a chance to play! It was popular!

Behind the Jaguar, facing the back wall of the "boutique" was one of
the 3DO R-E-A-L players with some fighting game. The wait was only
five minutes for the 3DO demonstrator.

With that type of exposure, a guess of 450,000 Jaguars by the end
of the year is reasonable.

It is rubbish. Please read on, sir.

> I don't need to be told that a CD-ROM adds more STORAGE capacity. Duh!!!

Nobody does, but too many people think that it immediately equates to great games.
Duh!!!

> All that storage capacity is used for KICK-ASS MULTIMEDIA GAMES!!!!

How many CD games are *really* 'kick-ass'? Developers still simply don't have
a clue what to *do* with all that extra space. Don't kid yourself, how many CD titles
are truly great? A kick-ass game needs first and foremost a kick-ass *design*,
something which 790Mb of storage space isn't going to produce out of thin air.
If you can make a good design but the graphics and sound to do it justice
won't fit on a cart, then use the CD by all means.

More often than not, though, you will find that, "All that storage capacity"
is used for pretty prerendered animations or FMV that ultimately have *nothing*
to do with *gameplay*.

> You talk as if "only adding more STORAGE capacity" is a point to be
> dismissed. I now point the finger in your direction and proclaim that to
> be the true RUBBISH.
>
> I don't know which has more "processing power," nor do I give a damn. I

Well there you go. To 'equal' a Playstation, the Jaguar needs more than just
extra storage capacity. Look up 'equal' in a dictionary. I point the finger
back at your esteemed self.

> just want to pop in a CD-ROM and play. Whichever plays the most great
> games and entertains me the most is the winner.

Will the CD ROM make great games, just like that? So if the one that plays what you want is the winner why should it concern you that "A Jag needs a CD to equal a Playstation,"? When you are comparing hardware, to equal is to match not necessarily specifications, but performance. Software is a totally different entity which you need to distinguish. In a nutshell, bolting on extra hardware (e.g. JagCD) will not provide you with instant kick-ass games.

Not interesting, you can't compare the Japanese market with the western
one, see NEC PC-Engine for details.

And, btw: market share isn't interesting to me when talking about
consoles, _games_ are.

Nothing wrong with the CD. Just the standard Mac tool kit.

I never said that all platforms were glitch free. I do not
>see the rational for investing in a vapor medusa that lacks a software
base.

The Atari software base suites me just fine. All those little
programs dancing around at the same time. You really should
look at the "dark-side" of the mac and see how much quicker
MagicCMac really is.

>Pentium and powerMac prices will be heading south...

Quicktime
>annimation and wealth of multimedia software?

Yes the Falcon can run Quicktime animation files (why would you want
to?). After running PhotoShop on my now half-ass running Quadra 950,
with 28 megs of ram, and watching it choke doing some KPT filters,
I have to admire the little Falcon. It can hang with its "sub-standard"
software (not my words). I know for a fact that if you say you "standard"
$999.00 Mac with 4 megs of ram can run PhotoShop, SinPlop, your full of
shit. It will die a terrible death. A 4 meg Falcon runs ApexMedia

just fine, and in a higher color depth. Neon works just as well (yeh, I know, you don't know what the f*#k Neon is). As for the 040-33, with no FPU I might add, it needs it just to get the software off the hard disk to load at a decent speed. Software that cost three times that of the compatible Falcon versions. As far as "multimedia" software is concerned, they are all just tools, it's up to the operator to make the final product. As a matter of fact, I have a video clip I made of a cat doing a SinPlop. I was going to use it for an SNL add, but what the heck, i'll make a QT of it and you can use it for a screen saver:)

I'd better stop now. I'm getting carried away :)

It sure is nice to know that the space is there, is it not? How much
does it cost to master a CD? You see them given away *FREE* in magazines
(under the plastic wrap) now. THere is a space benefit, and there is a
cost. I assure you that ROM cartridges cost more to produce (esp. huge
ones), hold relatively little, and are subject to wear and eventual
failure.

>
> More often than not, though, you will find that, "All that storage capacity"

Well, many games on the PC take 30 megs (megaBYTES not megaBITS as the
misleading Nintendo people refer to their "megs"). How is that going to
fit on a cartridge? I've played "Wing Commander III" and it is
kick-ass. Since a video game typically doesn't have a 30 meg hard drive
in it (nor any way to load one if it did) and I seriously doubt anybody
would want to endure the expense of a 30-megaBYTE ROM cartridge, then
perhaps a CD-ROM holds the answer. If you're trying to discredit the
CD-ROM, then good luck. Why are all the game makers going to it? Hmmmm????
For your information, Ridge Racer played pretty well off a CD-ROM last
time used a Playstation. I wasn't distraught at all because it wasn't on
a ROM. THere's a lot of detalied scenery which changes quickly. Gee,
it must take a lot of storage to do that. Damn good thing the CD offers
it, eh?

>

I know of no better way to start to "equal" a Playstation. Perhaps I was hasty in my choice of words. I should have stated that "it could come closer" to offering what a Playstation does.

> > just want to pop in a CD-ROM and play. Whichever plays the most great

> (e.g. JagCD) will not provide you with instant kick-ass games.

No shit. However, I reiterate *ONCE AGAIN* that the CD opens the door to a great potential for detailed games with LARGE storage requirements. My point is that the platform is better off with the CD than without it. I am well aware of what "software" is. The "need to distinguish" is yours.... You need to distinguish the reality of my contention from your misunderstanding of it. All I propose is that the CD offers ADDITIONAL POTENTIAL FOR KICK ASS GAMES!!! If there's anyone who needs to consult a dictionary, it is you. Look up the word "potential," then try to consider that the Jag CD will increase the Jag's potential, then come back and attempt to analyze my arguement from a more enlightened perspective.

Not that you should have know this but the mac tries to mount all volumes
when it boots up. To avoid it mounting hard disks you can hold down
command-shift-option-delete. That should have worked.

>No, the date of manufacture was July of 1994, assembled in Ireland,
>I believe.

They where making Q950 that late?! Holy crap.

>No, just a standard SVGA monitor. I didn't know they were so

They require more data to be passed to the video card. It means that you
need more logic in the monitor but it means that any mac monitor will
drive any (as far as I know) mac monitor as long as you have enough
VRAM.

>My point was that any machine can have it's weird little problems.
>SinDrop seems to think that God Blessed the Mac (and Iowa).

Of course all computers have their problems. And I'm sorry but I don't
read Peters posts. I think that we should start a private mailing list
just to keep him off of it.

On Wed, 11 Oct 1995 STIRRE31@MAINE.MAINE.EDU wrote:

> James,
> With all due respect, you keep talking about a student discount price
> on software. Not everyone has access to this. Or, should we include
> the tuition you pay to get this discount and then compare software
> prices?

Not everyone does, but a lot of people do. Most people know someone who is a student. They're not going to do a security/background check. You know what is more relevant than the fact that "not everyone" has access? The fact is that college students (whether they need to buy Papyrus or Microsoft Word) are the ones that need the biggest price break AFTER ALL. There's no discount for Papyrus for college students like me. Just because there IS for Word doesn't invalidate my comparison.

Person #1: College student who needs word processor.

Atari: Pay $150 (I'm guessing) for Papyrus
PC: Pay $99 for latest version of Microsoft Word

Person #2: Atari: Pay $150 (??) for Paypyrus
PC: a: give a college student a C-note and have them get Word
b: pay full price for Word ($150???)

As I mentioned, college students need cheap software more than anybody. No wonder that's why there are discounts (as well there should be) on such software. Simply stated, PC/Mac software is ***NOT*** expensive in comparison to Atari software.

Another example: HOw much is that Atari FAX software from Toad (I don't have my Toad catalog anymore)? I think it was like $100 or something. Just to send a fax!! Every $60 faxmodem I've ever bought came with throw-away FAX software for PC - but it did the job at no additional cost.

My intentions were simply to truthfully counter the accusation by an Atari user that "other platforms" have "expensive software" when in fact Ataris have (relatively speaking) expensive software.

> I was looking in MacWorld the other day. A place had Word listed for
> over $200, I believe. I will check again for you if you want.

Actually, I'd like someone to state the price (in U.S. dollars) of Papyrus, which can be found listed in the Toad Catalog.

> Your point about the software being more expensive then the hardware
> is silly. What's the point?

The point is that when I was running a 520/1040ST that would be lucky to bring $50-$100 if I was to sell it, why should I dump 1.5-3 times that much for a word processor to run on it? There's a very nill market should I decide to get rid of it. From my perspective, it's throwing good money after bad. What resale value is there?

I can run expensive software on a
> Mac Plus. If you'd like buy a Medusa to run Atari software on ;-).
> Seriously, I don't understand your reasoning. Isn't low-cost hardware
> a good thing?

Low-cost hardware is a good thing. Low cost software is a good thing. However, when it costs more for a word processor than for the hardware on which it runs, and there is very little resale value for either, then I see it as a rather large investment to pay more for the software than the hardware on which it runs. By the time the "cheap" Atari hardware is all upgraded with large hard drive, RAM, new TOS, 1.44 floppy, you're a good part of the way to what a new system costs, and you'll never come close to getting a reasonably value for it should you decide to upgrade to a different machine later because the market is so small. After enduring all that expense, you get SOCKED with the price of Papyrus? Maybe you make $100,000 a year and find the price of Papyrus, Fax software (etc) reasonable, but I surely don't. However, my beliefs aren't paramount to the issue. The issue is that "other platforms" don't have "expensive" software when compared to Atari. In a worst-case scenario, I'd say that buyers of Atari software are "no better off" than buyers of software for other platforms.

: should I decide to get rid of it. From my perspective, it's throwing
: good money after bad. What resale value is there?

Just about anything you buy will depreciate in value so the
question isn't about "resale value". The real question is
"how much will it cost to do what I want to do?" In the eight
years I've owned my ST, I think I've spent maybe $2500.00 on
application software and hardware upgrades to stay current.

On other platforms (Mac or Clone), it's not unreasonable to
purchase a *brand* *new* $2500.00 machine every four years.
Even then, you must add some "optional extras" to the base machine
just to make it suitable for use.

Clearly, my total cost of ownership is MUCH less when I compare
my ST to the other alternatives available at the time of my
original purchase: the IBM PC/AT or the Apple MacIntosh+.

So does it bother me that Papyrus may cost $25.00 more than
Clone software, knowing that I've saved a minimum of $2500.00
[more like $5000.00] so far compared to other computer users?

Not even a little bit.

-- George

BTW: With history as a guide:

Is it likely that new Falcon owners will still have new useful
applications for their existing machines in eight years? Yes!

Is it likely that Clone/Mac owners will still have new useful
applications for their existing machines in eight years? No.

If you're looking to avoid planned obsolescence, get a Falcon.

Gregor,
No, Atari is not moving back into the computer market. It was
posted as a joke.
However, I believe that Medusa is working on a 68060 machine so
it is a possibility someday :-). Also, C-Lab should have
new models based on the Falcon someday.

I'm sorry. This was intended to bait some of the abusers
of TOS platforms that seem to have taken up residence here.
The only truth to the 68060 Atari is in the form of a clone.
If you don't already know of it, it's called the Medusa and
is imported into the U.S. by the Lexicor Corp. A much better
place to learn what is current (sic) with Atari computers and
their clones is to visit the .st or .tech newsgroups.

> Mac Plus. If you'd like buy a Medusa to run Atari software on ;-).
> Seriously, I don't understand your reasoning. Isn't low-cost hardware
> a good thing?

The Medusa is a ripoff! $3000? Most likely..I can get three 630's with cdroms
for that price. The Falcon and the Medus are not low cost. I suggest you
better inform yourself.

> And, yes, I am the Atari user who made the claim about Mac software
> being expensive and, on the whole, I'd stick by this claim (unless you

Tell me what it does and I'll tell you if a PPC can do the same. BTW, wouldn't
the PPC version of Cubase have the same feature set as the Falcon version?

>Reaction: "I already have good MIDI software."

Perhaps, but can you exchange that data easily with the other 95% of the
computing world? One thing that developers seems to be using QT for is
designing cross platform music that will sound good without a MIDI device
and great with one.

You may as wait for the Barracuda 040 for the Falcon if you are
going to play that game. Why don't you take all your sweeping
funds and buy a real machine, like SGI?

Copyright (c) 1995 Business Wire, Inc.
Business Wire

October 16, 1995, Monday - 11:18 Eastern Time

DISTRIBUTION: Business Editors

LENGTH: 389 words

HEADLINE: Peter Sinclair Named Smart Valley CEO

DATELINE: SANTA CLARA, Calif.

BODY:
Oct. 16, 1995--The Smart Valley, Inc. board of directors today announced that
Peter Sinclair will serve as the new president and CEO of Smart Valley, Inc. Sinclair will immediately replace Dr. Harry J. Saal, who announced his intention to vacate the position in June of this year.

Sinclair was previously the vice president of business development for Mastersoft, Inc., which was recently acquired by FRAME Technology. Prior to Mastersoft, he was CEO of Software Transformations, Inc., which was acquired by Novell. He has held senior management positions with Apple Computer Inc., Hewlett-Packard Company and Software Publishing Corporation. A Silicon Valley native, he currently lives in Woodside. He has a B.S. in engineering from the Massachusetts Institute of Technology.

"In our search for a new CEO, we looked for an individual with a strong commitment to the community and a high degree of comfort with the Smart Valley environment," said John Young, chairman of Smart Valley. "Pete has these qualities, and his hands-on operating background will fit well with Smart Valley."

"I grew up in the Valley and have witnessed the transition from orchards to industrial parks," said Sinclair. "Through Smart Valley and its projects, I feel I can help preserve our quality of life by applying the expertise of our local industries to keep the Valley competitive."

Saal was hired as the first employee of Smart Valley in September 1993. He will continue to serve on the Smart Valley board of directors.

Smart Valley, Inc. is a non-profit organization committed to creating an electronic community based on an advanced information infrastructure. This mission is being lived out through collaborative infrastructure projects in

education, healthcare, local government, business and the home. Smart Valley has become the focal point for Global Information Infrastructure networking between member companies as well as other entities, regionally, nationally and globally. Smart Valley is affiliated with Joint Venture: Silicon Valley Network, a broadbased, grassroots coalition of initiatives.

>Has the PC totally wiped out all other competition such as
>Macs, Amiga's and ST or do these other machines still
>survive against the PC

Wiped out? Although I love them both, I'd have to say that yes, the ST and the Amiga are wiped out in the US. Amiga advocates are still a vocal group, though, and at least one magazine still existes for each platform.

Macs, on the other hand, are thriving. Granted, Win'95 has cut into the Mac-philosophy a little, but Apple can't build the machines fast enough. PowerMacs are still surpassing expected sales, and mre corporation's networks are looking into macs. Plus, home project-studio audio/video is expanding, as well as pre-press and in-house printing. Macs still dominate these markets.

Everyone always thinks macs are dying - won't happen (for at least 5 years ;-))

Ya know...

You must be in the wrong group. This has NOTHING to do with the subject at
hand. Please address your lettter to your mother using her e-mail address
and stop wasting Bandwidth.

I'm finally getting better at Tempest 2000. Any codes for that?
Any codes for Rayman BESIDES the breakout game?

Inna Godda Davida

Me too. I like the fact that the game is hard. But it seems
inevitable that unless I replay all the beginning levels over
again perfectly (so that I have more continues) there's no way
I'm ever going to finish this game. Saving the number of
lives/contiunes seems a bad idea. I only hope there is some way
to earn continues in the higher levels.

: equivalent performance since processor is fast enough to do it itself. I
: could of course be proven wrong if you give me function that the Falcon can
: do and the Mac can't. And what do you mean my "standard digital IO"?

Without rancor, or the intent of flaming, I must ask: do you know what a DSP is? (without rancor, since I am rather hazy on just what it is). I don't have a specification sheet, or exact defination, but your statement makes me wonder if you know less of them than I do.

A DSP is an extremely specialized processor, who's only goal in life is to deal with "signals" (whatever the hell they are!), and "do stuff with them". The samples I have let me take an analogue input, such as a microphone, and edit these signals in real time. (ie: I don't need to save them to disk, make the editing changes, and play the sound). There are also DSP applications that deal with voice processing. If you've ever researched voice mail, a voice card is similar to a modem, but often includes a DSP that allows one to "do stuff" with the incoming voice stream (such as compressing), that one cannot do with regular phones or answering machines. I imagine you could even do video processing with a DSP, since video is just a signal.

I would bring up D2D (direct to disk recording), but I am unclear just what that is...

The PPC, no matter how fast it is, simply cannot do what a DSP does. Otherwise, there would not be specialized voice cards (Dialogic in NJ is a vendor of these). An even more base example is the SoundBlaster card. These have (or can have) a processor called an ASP (advanced signal processor?), which let you do all the things a DSP can do. Without these, you can't use the microphone input (or if you can, you are limited to what it can do).

In short, the processor speed has nothing to do with it. There are many specialized processors that exist on the market, and these cannot be replaced by general processors like the PPC (or Pentium, or whatever).

Continuing to quote at incredible depths (most of it edited out this time) the one and only Peter Sinclair-Day (sinclap2954@cobra.uni.edu) wrote a lot and managed to communicate:

: The Falcon is a discontinued model from Atari.

Not true. It has been licensed to C-Lab and is still available.

:Atari no longer manufactures and supports it.

This much is true.

: Apple also announced a $699 6300 logic board upgrade for the 630
: series and 6200 series. I am tempted.

In prior years, Atari owners claimed you could get an whole new computer for the cost of an "upgrade" on other platforms. Since the base C-Lab Falcon is still available for $799.00, it looks like this claim remains true.

And as a bonus, you get a much more efficient operating system, scads of standard built-in ports, a DSP, room for a $59.00 math coprocessor, and compatibility with a software base extending back ten years or so.

Plus: Like other Atari computers, the Falcon doesn't catch fire.

: ROTFLMAO!!! [BTW -- That's a *lot* of laughing]

: > application software and hardware upgrades to stay current.

: Every consumer commodity has a resale value. You may not like to think
: about it, yet it does exist. Whether it's an automobile or a vacuum
: cleaner, there exists a market for second-hand products. To deny this is
: amongst the most specious of all arguements I've ever heard.

Aw, c'mon -- where did I deny the existance of a second-hand market?
The whole concept of depreciation is based on how much money you can
get for reselling an item. And my point was: how much does it cost
to accomplish the task at hand with the equipment you need? And I
demonstrated that it was *significantly* less expensive with an Atari.

: > On other platforms (Mac or Clone), it's not unreasonable to
: > purchase a *brand* *new* $2500.00 machine every four years.
: > Even then, you must add some "optional extras" to the base machine
: > just to make it suitable for use.

: Computer Shopper is filled with fully-loaded 486/66Mhz/80Mhz/100MHz+
: systems for around half that (if not less) and they are fully-loaded with
: CD-ROMs and sound and 8megs and software and certainly not lacking for
: "options to make it suitable for use." Once again, someone needs to make
: better observations. Yes, I loaded Pentium might cost that, but it's a
: damn fast computer and a clock-multiplied 486 is still bang-for-buck champ.

The '486 is dated technology (they're even sneering at it on the talk
shows here in San Diego), and 8 megs isn't really suitable for anything
more than casual use (...if you're running Microsoft Windows, that is...).

: I've also seen fully-loaded Mac systems at/around $1000-$1200, but I
: don't know enough about them to elaborate.

We'll probably hear from sinclap on the matter <g>. However, it takes
a MacIntosh running a better processor and double-or-faster clock speed
to equal the performance of the comparable Atari machine.

: > Clearly, my total cost of ownership is MUCH less when I compare
: > my ST to the other alternatives available at the time of my
: > original purchase: the IBM PC/AT or the Apple MacIntosh+.

: I agree; that's why I bought the ST. However, if there is ever a system
: with hidden costs to make it "suitable for use," it's the ST. By the
: time one adds new TOS, 4-megs of RAM, 1.44 floppy, etc.etc.etc they're
: way in over the cost of a competing platform and would have to give it away.

TOS Upgrade: $59.00
Floppy Upgrade: $100.00
RAM Upgrade: $100.00 plus RAM (same cost on all platforms)

$259.00

(source: Toad Computers catalog)

: > Is it likely that new Falcon owners will still have new useful
: > applications for their existing machines in eight years? Yes!

: There will be very few "new Falcon owners" TODAY, let alone 8 years from
: now. What planet are you on? The great dearth of Falcon software has
: been the bane of the Falcon (and most Atari products) since its
: introduction.

"Lots of software" is always comforting, but how many of the 45
Clone spreadsheets do you actually need? How many of the 237 Clone
word processors do you actually need? How many of the 68 Clone
databases do you actually need?

My guess is that you'll only need one or two applications in any
given category. Surprise! Falcon owners can choose from several
applications in each category as well. While we don't have the
luxury of learning to operate 237 different spelling checkers, we
do have spelling checkers in our software!

: The tiny niche Falcon market is too small to attract much
:software development,

There is a good selection of software that runs on the Falcon,
just check out the 56-page catalog from Toad Computers or look
at all the advertisements in ST Informer.

: and the fact that the Falcon isn't even close to being
: "totally compatible" with its predecessors makes matters worse.

80% of existing ST software runs on the Falcon and you claim
that it "...isn't even close to being 'totally compatible' with
it's predecessors"? I disagree!

: Having said that, what is going to convince software devlopers to produce
: for the Falcon in 8 years? I'd like to know why you believe that, honestly.

1. Because the Falcon hardware is still in production.
2. Because the Falcon is still being actively marketed.
3. Because the new software already available is leading edge stuff.
4. Because Atari owners enjoy their platform and support each other.
5. Because clones of the Atari computer are becoming available.

: > Is it likely that Clone/Mac owners will still have new useful
: > applications for their existing machines in eight years? No.

: Ha!! 8 years is an eternity in this industry. However, there are so
: many Clones and Macs out there (than other designs) that I'm sure there
: will still be a market.

Go ahead and wander down to a CompUSA or a Computer City and try to
buy some new software that will run on an IBM PC/AT or an Apple
MacIntosh+. You can't!

Then check the recent software offerings for the Atari computers
and you'll see that a lot of it will run on an 8-year-old ST.
That's why it's cheaper to perform a task on an Atari instead of
a Clone or an Apple.

A: > If you're looking to avoid planned obsolescence, get a Falcon.

: What are you saying? Just because the Falcon was the "flagship" of the
: Atari line and they quit making computers after it, then it will always
: be a "flagship" and thus have eternal status as such?

Nope. I'm saying that it's much more likely that when new software
is released 8 years from now it will run on today's Falcon, based
on the fact that new software released today will run on an
8-year-old Atari ST.

: Just because my 486/80Mhz isn't the fastest PeeCee there is,
: it's automatically obsolete? I rather doubt the latter.

That's the word on the street. 486's are out, Pentiums are in.

: I'm not the type of person who HAS TO HAVE the "latest and
: the greatest."

True. But you *do* have to own a machine that will run the software
you buy. That's where Clones and Apples put you at a disadvantage.

: I suppose if that is your sole
: criteria for purchase, you could see things that way. I really don't
: care what the fastest new Pentium/Pro is. When my current machine fails
: to serve me, I'll have to sell it or toss it in a shitbox and get a new
: computer.

That's what I said originally! Cloners need to spend about $2500.00
every four years to perform their task, while I've only had to spend
$2500.00 in *eight* years. It's cheaper to perform the task with an
Atari computer.

: Relative to new, innovative designs, all current computers
: will become obsolete. What makes you think the Falcon is immune to
: this?

Not immune, just resistant.

: The very fact that you believe so clearly illustrates how unrealistic
: your arguments are.

Some people buy a computer to "follow the crowd" or to "impress their friends" or even to "get free software from work". I chose my computer because it was the most cost-effective way to accomplish my task. What is realistic to me is clearly not realistic to you.

Do we agree to disagree on this matter, or shall we go around again?

Yeah!

>lives/contiunes seems a bad idea. I only hope there is some way
>to earn continues in the higher levels.

Why do you want to earn continues?
Surely earning lives is at least as good, and it's very easy.

Just remember that you get a new life for every hundred 'tings'.
Those 'tings' are available in abundance in the first two swamp levels
for easy picking. In fact there is a bit over 70 'tings' in each of
those levels IIRC.

When I'm running low on lives or have something tricky to take on, I
spend half an hour or so playing the second level, over and over.
With a little practice each run should not take more than 2:15 or so.
Saving after every three runs will give you two extra lives per seven
minutes. :-)

>makes me wonder if you know less of them than I do.

A DSP is specialized processor designed to process digital signals. It
is usually heavily optimized for floating point operations. In particular
a DSP can usually do fp multiply and fp add very quickly. Some can do
both in a single instruction. This allows a DSP to process matricies very
quickly and that is the usual format of digital signals.

>The PPC, no matter how fast it is, simply cannot do what a DSP does.

>Without these, you can't use the microphone input (or if you can,
>you are limited to what it can do).

This is were you are wrong. The processor can do anything that the DSP
can do. It's just that a DSP can do some functions faster than the
processor. It also allows the processor to offload some functions to
the DSP and process other instructions itself in parallel. So a
fast enough processor can do everything a DSP can do plus some things that
a DSP cannot do. The original Power series (from which the PowerPC was
desived) was designed for rapid fp calculation. The 601 has a single
instruction that can do a a fp multiply and add. And the latency is
less than ten cycles (I can't remember the exact number). In some
benchmarks the 60Mhz 601 (the absolute slowest) was just BARELY beaten
by a 40-MHz 68040 and a 66MHz AT&T DSP. The Falcon does not, of
course, have a 40-MHz 68040 or a 66MHz DSP.

>In short, the processor speed has nothing to do with it. There are many
>specialized processors that exist on the market, and these cannot be
>replaced by general processors like the PPC (or Pentium, or whatever).

The reason that you don't want to replace a processor with a DSP is
that processors that are equally rapid doing FP calcs are more
expensive.

But the Falcon DSP does not waste it's time running MacOS.

The Falcon DSP is usually directly accessed, not via OS.

The Falcon DSP has a digital port for IO.

In short: the Falcon gives the musician more than the Mac at a lower cost.

>box in the first place. Poor misguided souls.

A 604 PowerMac can run 040 software faster than any Quadra, including the Q840AV. And you don't have to change you software just to get PPC software. All the current releases of major software have included a PPC version. So if you the latest version of Photoshop, Deltagraph, Freehand, Illustrator, QuarkXPress, PageMaker, Director, Nisus Writer, Claris Works, WordPerfect, Word, Excel, FileMaker Pro, etc then there will also be a PPC copy on the disk/CD. Care to give me a counter example? And, except for the MS products, most benchmarks show the PPC to be faster than a Pentium box. And, of course, if you use a PC then you might have to use Windoze...

2926. Atari & falcons

Newsgroup: comp.sys.atari.advocacy
Date: 1995-10-20 00:00:00 UTC
From: sanson@galaxie.int-evry.fr
Message-ID: <467r8s$clg@news.cict.fr>
Source record: 11131

Hey, i've just read in the French ST Magazine that Atari was
manufacturing a few thousand new falcons, the first time since
they abandonned the computer market. Looks like they need some fresh cash
for some reason :) And that there are some people who still want
to buy a Falcon despite the fact that to most people it doesn't even exist !!

Now why would anybody in his right mind want to buy a falcon now that
Windough 95 is out and buggin' ?

I wish somebody could tell me that, cause i own a falcon, and i sometimes
wonder why ? :) :) :)

I guess it's because sometimes i HAVE to work on PCs or Macs ....

PS: I read something funny about the new "state of the art" SpeedoGDOS
lookalike printer driver that Microsoft is trying to sell with his
new OS. THey had already riped off the desktop, now what ?? The DSP chip ?
Maybe they hired the folks who wrote the atari's ROMs :):):)

Well, i guess good ideas always last, and some have them before the others.

2927. Re: Atari & falcons

```
: Hey, i've just read in the French ST Magazine that Atari was
: manufacturing a few thousand new falcons, the first time since
: they abandonned the computer market. Looks like they need some fresh cash
: for some reason :)

Eh? Atari's in a healthier financial position than they've been
in years. Perhaps they want to push the Jaguar more at X-Mas which would
be a good thing.

: Now why would anybody in his right mind want to buy a falcon now that
: Windough 95 is out and buggin' ?

Musicians perhaps? Or maybe Atari will sell the Falcon at a new
low price?

You have been. In fact, the above reply shows that again. It seems
like in the rage of flame-wars over here, just being associated with
Mac immediately brings guys like Sinclap into mind - so you're flamed
straight away.

I see it happen over here very often that some dork starts a thread,
everybody gets mad, and if anyone sensible tries to add some facts,
he's just flamed for being `of the wrong camp'.

Personally, I think the PPC is a pretty impressive chip. If a Linux
were available for PowerMac, than this machine would probably be my
next computer. As it is now, I will probably use my Falcon until it
finally dies, buy a big fat pentium (or P6, at that time) with Linux
and continue my computing on that box.

Try System Solutions, The Upgrade Shop, Compo, Gasteiner... for new drives.

If you want to build one yourself the simplest is to get a SCSI-host adaptor
and a SCSI-drive. You can also use IDE-drives if you get a IDE host adaptor.
These are more difficult to install and harder to get, but the drives are much
cheaper.

You can use any SCSI hard drive on the ST, the only thing you need is the Link
that allows you to connect any SCSI HD to the DMA port on the ST.

>processor.

Nope, your wrong.

>
>benchmarks the 60Mhz 601 (the absolute slowest) was just BARELY beaten
>by a 40-MHz 68040 and a 66MHz AT&T DSP. The Falcon does not, of
>course, have a 40-MHz 68040 or a 66MHz DSP.

So you are saying the Falcon is as fast or faster than a 601 60mhz?
You must. I use an 040/40 and while it's running the Mac OS, the
Falcon is compairable in speed. Now if your running the Mac with
MagicC, that's another story. We're not talking CPU benchmarks here.
If you can't open the car door as fast as the other guy, he'll
probably beat you to the end of the mile. In other words, I'll bet
I can boot my Falcon and load a 100K .JPG quicker than you can on
your PPC. I'll go even further.I'll bet I can do the above, digitize
1 minutes of 180*100 16bit color video and save it off to where even
a PC can view the file. Oh, ya, it will be a much higher quality
than QT too. It will also be a LOT less expensive than the Mac options.
So, where do we draw the line at which machine is the fastest? Which
is the best? Let me see now... I can still buy a Falcon. The software
is still very well supported. I can get hardware and software second
or even next day. I think I just talked my self into a C-Lab Falcon.
I've been pondering the idea for a while, and Toad will throw in
Cubase for a song <grin> so what the hell. Now i'll have two. And
I think i'll keep my 1040 and my Mega. The 486 does this net stuff
pretty good, so it can stay. If I can ever get the MacMall to send
me my fu*king fries, I'd be happy.

Have fun this winter,

Mike

: Can I buy one localy? The Falcon has been discontinued by Atari.

Probably not. But even if you could, you wouldn't know because
you've never looked.

: If you are a Falcon owner, how do you upgrade to something higher?

Read a few ST magazines.

: versions. What is your point? You can't even find ST software localy.

We doesn't live in your hick-town. He probably has no problem
buying stuff for his Falcon.

: Ah, a selling point.>..But you still have that mushy keyboard!

How would you know? You've never seen a Falcon, let alone typed
on one.

: > : > just to make it suitable for use.

: It's not unreasonable to spend $1500 for a Dell Pentium and Mac 631cd one as
: well. Doesn't the Falcon cost $1900 fully loaded?

If you're talking "fully loaded", then $1500 for Dell or Mac is too low.
Fully loaded Dells and Macs are easily $2500, and during this weekend I've
seen some "ultimate clone systems" at *discounter* Incredible Universe for
$3000.00.

Get a fully-loaded Falcon and save $1100.00. And get a more-efficient
operating system. And associate with a great group of computer
enthusiasts.

: > The '486 is dated technology (they're even sneering at it on the talk
: > shows here in San Diego), and 8 megs isn't really suitable for anything
: > more than casual use (...if you're running Microsoft Windows, that is...).

: And the expensive Falcon is not?

[assuming he means "not dated"]: It's been around for a year or so,
so that makes it an "established" machine. And with the availability
of the DirecTT, Medusa, and Eagle it may be replaced by these faster,
compatible machines in the next few years.

: > We'll probably hear from sinclap on the matter <g>. However, it takes
: > a MacIntosh running a better processor and double-or-faster clock speed
: > to equal the performance of the comparable Atari machine.

: Oh, please! Are you comparing a PPC Mac running Photoshop to a ST
: running a screen saver? What a comparison. You can't even compare
: because the ST/Falcon is soo behind.

No, I'm referring to the benchmarking done by Digital Equipment
Corporation several years back when they unveiled their "Alpha Processor"
system. Completion times were:

Apple Mac Quadra 12 seconds
Clone 486/66 MHz 6 seconds
DEC Alpha 5 seconds

Atari was running the same benchmark on the Falcon in 4 seconds.
Obviously, I'm being generous to the Mac when I say it only needs
a better processor and double-or-faster clock speed.

: > : > Is it likely that new Falcon owners will still have new useful
: > : > applications for their existing machines in eight years? Yes!
: >
: Yea, right.. The Falcon lacks a web browser! Its your right to hold onto
: something that has failed!

Not only is there an on-line web browser, there is also an OFF-line
web browser for the Falcon. Do your development work offline or view
your stored favorite page offline and save on connect cost!

: Forgot web browsers,

Nope....

: games,

That's what Jaguars and Clones are for. (I've never met anyone who
felt the Mac was a serious contender in the game machine category. :-)

: and multimedia apps

You mean like Apex Media and Expose?

: ...Doesn't take a genius to figure out to spend as much money on
: the dead Falcon to the other cheaper platforms that have a wealth
: of apps and hardware!

The other platforms are cheaper because they don't offer all that the
Falcon offers. That was demonstrated above.

: Again, what planet are you on?

This is why I suspect your internet connection is from the newly
discovered planet orbiting the star "51 Pegasus". I'm here on earth
and well-grounded, thank you.

: GET WITH THE PROGRAM!

Ah, yes. "ReBoot!" Lovely eye-candy, clever computer in-jokes,
and plotlines that always manage something unexpected. It really
should be a prime-time show.

: > My guess is that you'll only need one or two applications in any
: > given category. Surprise! Falcon owners can choose from several
: > applications in each category as well. While we don't have the
: > luxury of learning to operate 237 different spelling checkers, we
: > do have spelling checkers in our software!
: >

: Who needs to learn on how to operate spell checkers?
^^^^^^^^^^^^

Or grammar checkers <g>.

: > There is a good selection of software that runs on the Falcon,
: > just check out the 56-page catalog from Toad Computers or look
: > at all the advertisements in ST Informer.

: 56 pages of Falcon stuff? I don't think soo. I have a Toad catalog..

That's what "compatibility" is all about! Software written for
the ST runs just fine on the Falcon. Are you implying that each
new MacIntosh model causes the existing catalog of Mac software to
become obsolete?

: > : Having said that, what is going to convince software devlopers to
: > : produce for the Falcon in 8 years? I'd like to know why you
: > : believe that, honestly.
: >
: > 1. Because the Falcon hardware is still in production.
: Not by Atari..

Atari designed, C-Lab produced (with improvements!).

: > 2. Because the Falcon is still being actively marketed.
: What continent?

Europe, United States, etc.

: > 3. Because the new software already available is leading edge stuff.
: And what is leading edge? Screen saver?

Multimedia. Are Macs users still entranced by screen savers?

: Are you sure that the above does not apply to other platforms.

There's a good chance it *does* apply to other platforms. Does that
mean all the other platforms are as objectionable to you as the Falcon?

: Again, what planet are you on!

Earth. Is there a name for the planet you're on, or is it still
"the planet orbiting 51 Pegasus"?

: So, you are going to reccommend to a new user to standardize on a
: obsolete platform? ^^^^^^^^^^

See also:

: Who needs to learn on how to operate spell checkers?
^^^^^^^^^^^^

If you're asking if I'll recommend an under-performing Mac to a new
user, the answer will be "it depends on the support". New users are
normally confused and just a bit scared of their machines, and what

they need most is someone to guide them through.

I help new users with clones, macs, unix, and atari systems. And you?

: What a bunch of bull. I paid $999 for my machine and came with
: lots of apps.

Try to buy new software for it in four years. Most likely, your machine
won't be capable of running it. Most of the new Atari software runs on
the ST just fine.

: What planet are you on?

Still here on planet earth.

Did you know that the inner planet at 51 Pegasus completely revolves
around it's sun every 5.4 earth days? Such a short year would tend
to cause an excessive proliferation of new computer models (the "annual
product launch" concept) ... just like Apple's MacIntosh line ... hmm,
I think we're *on* to something, here!

: > Some people buy a computer to "follow the crowd" or to "impress their
: > friends" or even to "get free software from work". I chose my computer
: > because it was the most cost-effective way to accomplish my task. What
: > is realistic to me is clearly not realistic to you.
: >
: Like my $999 Mac that does the job wonderful!

That's what it all comes down to! If you're happy with it based on
your own criteria, then it's the machine for you. Our difference of
opinion is based on what we expect from our computers.

guenther@cabal.shnet.org (Thorsten Guenther) writes:

>But the Falcon DSP does not waste it's time running MacOS.
>The Falcon DSP is usually directly accessed, not via OS.

Neither is the Mac's DSP. The operating system only provides one API routine for the DSP, a routine that checks to see if you actually have one. Other API routines may use the DSP if you have one but the way the DSP is set up only one program can use it at a time. That means the MacOS will not burn up DSP cycles when your program is using it.

>The Falcon DSP has a digital port for IO.

Did we decide that the GeoPort doesn't count? It's definately digital, it definately does IO. What else does it need to be as good as the Falcon's?

>In short: the Falcon gives the musician more than the Mac at a lower cost.

If you make this statement because of your three other points then you might want to reconsider.

[price stuff deleted]

Sorry, since we where talking about hardware I assumed that any benchmarks
would include the hardware only. I will concede that the Falcon would restart
and load a 100K .JPG faster than my Mac. That's because the Atari boots
faster than the mac. If all we had to do is double click on the JPG then,
assuming similar JPG viewers, I claim that the PPC would be faster. The
digitizing example seems silly. It can only take 1 minute to digitize 1
minute of video. The Mac uses it's own file system while the Atari borrows the
PCs so obviously the Atari should be faster at saving onto PC media (if I
understood your point). And, not to flame, but a lot of people don't seem
to understand exactly what QT is. QT is an engine not a format. QT will play
back any video file as long as there is a plug-in for it. The normal plugins
are MPEG, cinepak, animation, component video, YUV and JPEG (just a file
that has each frame stored in JPEG). So, for example, if your Falcon is
digitizing into MPEG format and you compare it to a Mac digitizing cinepak
then the Falcons will look better. Cinepak is the usual mac format because
it is usually smaller than MPEG. But, if you want quality and have the
disk space, go for uncompressed. That will be the best possible quality.
A better benchmark would be "how many fps can you capture in 24-bit mode,
a 320x240 movie, saving direct to disk, using on-the-fly compression into
MPEG?" or something like that.

: $3000.00.

I have to agree with this. We are puchasing about $30,000 worth of the
following Dell systems:

Dell XL575 75MHz Pentium
16mb of RAM
540mb hard drive
15" Sony Trinitron monitor
Keyboard, mouse
Sound card built into the system board
Altech Lansing speakers
CD-ROM
3c5x9 Ethernet also built into the system board
Win95
Etc

The total price was $2700.00, AFTER discount. When you drop the multimedia
equipment, and get the CTX monitor, then you are approaching $2200.

But, I must qualify this purchase, that it is the "corperate" line,
meaning that you are "guarenteed" consistancy of components, no
matter what. ie: all systems ordered with 540mb will have WD Caviers.
They sell a "personal" line, which is probably $500 cheaper, but you
don't get the consistancy.

Unless one wants to spend money on the absolute bottom of the line
equipment, you honestly can't get under $2,000 when building a
Pentium machine.

(the consistancy factor is important when one has to juggle hundreds
of systems in widely spaced areas).

: What is this consistancy? Are Falcons guaranteed consistancy?

Falcons are consistant, altho it is unstated. The original Falcon
had a 65mb (forget the manufacturer), and the last production
run had Connor 85mb drives. Since the RAM boards are propriatary,
that doesn't count.

: >
: > Unless one wants to spend money on the absolute bottom of the line

guenther@cabal.shnet.org (Thorsten Guenther) writes:

>Gosh, you want to discuss discontinued and never well-supported features
>of _two_ (also discontinued) Macs?

Not really. If I remember correctly, the argument went something like
as fallows:

Someone - The PPC Macs cannot be as cool as the Falcon because they do not
have a DSP. A DSP is required to perform specific tasks.
Me - A DSP is just a processor designed to do specific tasks quickly.
The PPC processor is fast enough to do these tasks itself. For
example the Q840AV is just slightly faster than a 6100/60 when
using it's DSP.
Someone - Liar! A DSP can do things that a processor cannot.
Me - Please provide an example.
Someone - Since the 6100/60 is almost as fast as the Q840AV and the Falcon
is faster than the 6100/60 then the Q840AV must have an inferior
DSP implementation. Comment: This is good reasoning if you accept
the premises.
Me - [A description of the AV 68K macs DSP system.]
You - Why are we discussing this?

>...and AFAIK the 660av doesn't have one. That leaves the 840av to
>discuss.

Actually, the 660av did have one.

>Cubase Audio 16

Isn't Cubase Audio available for the Mac?

And C-lab has the gaul to charge soo much for a slow 030 machine! I was just
on the Toad web and about fell off my seat when i read the prices..You got to
be kidding.

PowerComputing is the one. The $2000 is a rumored price, just a rumor! An
announcement any day now.

Best Buy must be simply a name. They'd have sold long ago if they were
priced right. Is it the Macs fault that Best Buy is full of old stock
because they can't turn over their hardware?

I see Falcons sold at Toad with 80-meg hard drives.

Am I to infer that the point of the above is to tell me that the 16Mhz
Falcon has more horsepower than the above systems???
Oh, I see ATARI was running the benchmark on their own computer and beat
out the rest. This must be the same Atari that got flamed in NextGen
magazine for claiming the Jaguar was more powerful than the Saturn.

> : games,
>
> That's what Jaguars and Clones are for. (I've never met anyone who

Then what's the Atari for? If I have to get a Clone, I may as well do my
word processing, etc on it as well.

Then why won't all the games run on the Falcon? There should be no exceptions. "Compatibility" is an absolute term.

> : > 2. Because the Falcon is still being actively marketed.
> : What continent?
>

No, not in the United States.

>
> I help new users with clones, macs, unix, and atari systems. And you?
>

I certainly wouldn't want to recommend an Atari system to a new user. Could you imagine the frustration of not being able to get software in your hometown while all the neighbors do - and to be so limited? Falcons are good for seasoned Atari pros, but bad for beginners.

>
> Try to buy new software for it in four years. Most likely, your machine

> your own criteria, then it's the machine for you. Our difference of
> opinion is based on what we expect from our computers.
>

True - but let's not justify our opinions by distorting the truth with ridiculous claims that the Falcon outperforms all other plaforms, that we can get lots of new software, that we can run all old software (games included) on the Falcon, that the Falcon is a great starter computer, that the Falcon can be all things to all people, that 8 years from now things will be peachy with the Falcon. 8 years ago you could get new software for the Commodore 64. Does that mean I can now or in 8 years?

Maybe in NZ but not in USA.

> The anything86 series is dated technology, like about 20 years out of
> date - the 486 is just a very overclocked XT.

No - the newer x86 designs have L1 and L2 caches, pipelining, branch prediciton, multiple instuction processing. Must I go off about the differences between XT monochrome text and SVGA truecolor graphics? I think you get the point: YOU'RE WRONG. They had all that stuff 20 years ago, eh?

> : :
> : : And the expensive Falcon is not?
> : :
> Only about 2 years not 20

HA HA HA!!! 2 years? So the 68030 was developed 2 years ago and the Pentium 20 years ago!! HA HA HA HA HA!!!!!! In truth, a 16 Mhz 030 was pretty much a puss even when the Falcon debuted.

> At the time the Atari ST kicked butt of everything else about for the
> price, I got mine for running Notator SL. And now the Falcon is the one
> to compare. Very nice and no hidden costs either.

The Falcon never had the advantage that the Atari ST had. Not even close. That was a decade ago, however.

> The Falcon has a web browser. Even the 520 ST has a web browser.

How do those color pictures look on a 4-color display (520ST)?

> Earth idiot. And the apps for the Falcon are cheaper than the apps for
> the PC.

Bullshit. Papyrus is expensive - we've been through that here.

> Try dumping the PC, the Falcon kicks butt.

16Mhz 030s kick but....in a pig's eye.

> : :
> : : 56 pages of Falcon stuff? I don't think soo. I have a Toad catalog..
> : :
> 15000 archives of Falcon stuff on one of the net sites so don't give us

> fact the commercial stuff on the PC is worse than some of the PD Atari stuff

Take those 15000 archives and multiply them by a factor (2, 3, 4, 10???)
and that's how many Mac/PC sites they'll be. Your arguement applies to
other platoforms as well, but greater in magnitude.

> Even though 80% of the software for ST's works, who needs it when there
> is heaps already for the Falcon

HEH HEH HEH!!! "HEaps" mean different things to different people,
obviously!!

> Falcon. Heard of the C-LAB Falcon 040?

So we're little more than 4 years from the year 2000 and a 040 is the
hottest setup now, eh?? HEH HEH!

WRONG. Time Warner is selling a substantial share of their stock in
order to raise money. This cause ATC to tank. TW announced this quite
a while ago, that they had planned on selling their share in several
companies in order to raise $1 billion.

IMO, with ATC at 2, now is a great time to buy. They're sure to have
a good Xmas.

In article <46m0cg$r0d@morgoth.sfu.ca> quinlan@news.sfu.ca (Brian Quinlan) writes:
:>Someone - The PPC Macs cannot be as cool as the Falcon because they do not
:> have a DSP. A DSP is required to perform specific tasks.
:>Me - A DSP is just a processor designed to do specific tasks quickly.
:> The PPC processor is fast enough to do these tasks itself. For
:> example the Q840AV is just slightly faster than a 6100/60 when
:> using it's DSP.
:>Someone - Liar! A DSP can do things that a processor cannot.
:>Me - Please provide an example.

A motorola DSP 56001 (for instance) can do the following instruction in
1 instruction cycle.

MAC x0,y0,a x:(r0)+,x0 y:(r4)+,y0

this is a multiplication,add and two memory loads and two pointer updates
in one cycle. The PPC processor would probably take around 10 cycles to
complete this 'set' of operations. Therefore, for some specific tasks DSPs
can be (and are) many times faster. However there are only a limited number
of applications which gain this type of speed-up - a PPC, or indeed any
fast CPU(Pentium,Alpha,PARISC etc) can compete against DSPs for a wide range of
signal processing applications.

The financially-concerned James Wood (jamesw@PEAK.ORG) wrote:

: > > TOS Upgrade: $59.00
: > > Floppy Upgrade: $100.00
: > > RAM Upgrade: $100.00 plus RAM (same cost on all platforms)
: > > -------
: > > $259.00
: > >
: > > (source: Toad Computers catalog)

: Ok - what's the two-way shipping charge to mail my "non-expandable"
: ST in to have all that done? How much labor will it cost me? How much
: downtime? Remember that everything is soldered in on the Atari, and
: perhaps I can do the TOS myself - but I may as well have them plug it in
: while they have the thing open. Oh - how do I know if I have the "proper
: AJAX" chips (or whatever?). I was trying to determine if I could get
: this done to my 520ST and was answered with some indifference.

Service Charge Estimates

Two-Way Shipping (UPS) $ 25.00
Labor (Generous) $100.00

Subtotal $125.00
Plus Parts $259.00

Total $384.00

That's even less than sinclap's under-performing $999.00 wonder, which
certainly refutes your claim that it's cheaper to buy another computer
than to upgrade!

[Web Browser Comments Edited -- They're Answered In Other Postings]

: > > "Lots of software" is always comforting, but how many of the 45
: > > Clone spreadsheets do you actually need? How many of the 237 Clone
: > > word processors do you actually need? How many of the 68 Clone
: > > databases do you actually need?

: So it's the old "I can't get any so I'll walk down the Path of
: Renunciation" arguement??

Since I noted that there are several choices available in each of the
main applications, I'm certainly not claiming that "I can't get any."
Are you having difficulty following the discussion?

: Another twist: "Fox can't get the grapes so they must not be
: sweet anyway?"

I haven't said anything derogatory about software that's not compatible
with the Falcon or the ST.

: Sorry, but there ain't that many duplicate programs. There is a
: LARGE DIVERSITY.

A large diversity of word processors. A large diversity of databases.
A large diversity of spreadsheets. A large diversity of telecommuni-
cations programs.

Most computer users will only operate six or fewer programs on their
computer. It doesn't matter that there are 237 different word processors,
since they only need one of them.

: > The Falcon is a throw away wedge piece of litter, get over it!

: Heh heh heh!!! Now, I'm not going to go as far as say the Falcon is that
: bad - I just want the truth. The truth is that it's not (anywhere close)
: to being a kick-ass cutting edge system. Can't get any software.

Software is available on-line, by mail, and at dealers supporting
Atari computers.

: > > 80% of existing ST software runs on the Falcon and you claim
: > > that it "...isn't even close to being 'totally compatible' with
: > > it's predecessors"? I disagree!
: > He he he

: YEAH RIGHT!!! Look at the games section where they list everything
: that's Falcon compatible with a little asterick. Probably more like
: 20%.

Did you see the little note in the upper right corner? It says:
"A check next to a title means it has been tested on and is
compatible with the Falcon030. Other titles have not been tested
or do not work...." ^^^^^^^^^^^^^^^^^^^^

Obviously the list is not complete, which means that games
compatibility will be greater than 20%.

Also: 75% of all games sold in the US are for the various Clone machines.
If you're looking for a game machine and not a serious computer, then the
Falcon is obviously not for you.

BTW -- I was referring to all existing ST software in the
"80% compatibility" statement, not just the games.

: And at those prices, I can probably buy BOTH a MAC and PC, or a PowerMac
: that's DOS compatible. Uhh....difficult choice. Let me guess which one
: the marketplace will make.

A maxed-out Clone at Incredible Universe retails for $3,000.00. A
maxed-out Falcon retails for $1,900.00. Nope, I don't think you

could buy BOTH a MAC and a Clone. You couldn't even buy just the
clone.

: I haven't seen an Atari ad (for anything, not even games) in months,

Check out the Jaguar ads on the late-night talk shows.

: haven't seen a computer TV ad since Alan Alda was the spokesman for the
: then-new Atari XL lines, never seen an ad for an ST (not even when they
: were hot), and I doubt Falcon ever made it to TV. Do you mean they're
: spouting off about 16-Mhz processors on national TV?? Where??? Where do
: I tune in?

It's true the Falcon isn't being marketed via TV -- but I see the print
ads in ST Informer and ST Format, and can visit the Toad Web Site.

: > > 3. Because the new software already available is leading edge stuff.

: Now we revert to the "we already have it so we don't need more"
: arguement.

No. It's a statement that new software is available for the
Falcon, and that it's of leading edge concept and quality.
Is English a second language for you?

: > > 4. Because Atari owners enjoy their platform and support each other.

: Can you think of **ANY** computing platform where things are different?
: PC/Mac and even Coleco ADAM and Timex/Sinclair 1000s have usergroups
: SOMEWHERE.

He wanted reasons, I was being complete.

: > > 5. Because clones of the Atari computer are becoming available.
: > >

: At prices that could get me into a new Mecedes S-class. Heh heh.

With performance that make both the Mac and the Clone look very bad.

: That's because there's an EON between hardware generations (er, there
: was, since there's no more). Just bacause Atari owners are saddled with
: DEAD END hardware (reference: 16Mhz processor) is no reason to turn
: that around into a "I can still run all the new software on my old
: computer."

That so-called "Dead End hardware" smoked an Apple Mac Quadra and had
a 66 MHz '486 breathing heavy just trying to keep up. An efficient
architecture coupled with an efficient operating system outplays raw
Hertz.

: People WANT to upgrade - I enjoy buying a new computer as
: much as a new car - particularly when I can sell my old one (yes, at a
: loss, but not as much as you) and when my new model is a
: bang-for-the-buck champ over the last one.

WANTING to upgrade is different from being FORCED to upgrade, a
requirement of running with the Clones.

: Too bad that with the Falcon, not only can you NOT upgrade (save
: for overpriced German clones - I'm talking ATARI here), but you can't
: even run all the old software.

Yes, there are hardware upgrades for the Falcon -- the upcoming '040
processor, the 32 MHz upgrade, the expose video board, etc.

And the ability to run 80% of all the old software is pretty good!

: Don't try and tell me that 80% of the software is compatible - I've seen
: people try to get GAMES to run on the Falcon - good luck in many cases.

Software is more than games. 80% of all ST software will run on the
Falcon.

: The past is never a good indicator of the future in this changing
: industry, son. 8 years ago, I couldn't get 1-gig hard drives for under
: $300 (maybe less now). Just an example.

When you're discussing technological trends, you may be correct.
But when you're considering the development of software, I choose
to differ! To achieve the greatest level of sales, software developers
will make their offerings compatible with as much of the computer line
as possible.

: What's clearly realistic to me is that the Falcon clearly went by
: the wayside like the Atari 8-bit, Apple II, Coleco Adam, Commodore
: 64, etc...

Falcon: STILL In Production
Atari 8: Not In Production
Apple II: Not In Production
Coleco Adam: Not In Production
Commodore 64: Not In Production

Wrong again.

: I'm sure there are users of those platforms that think they had it
: all and that anything else wasn't necessary.

Naturally, I don't think I've "got it all", because NONE of the computer
platforms can claim that!

: It's not very clear to you that you're in the same boat. It is to me.

It all comes down to: how much does it cost to perform the task?
Clone users spend about $2500.00 every four years while Atari owners
spend about $2500.00 every eight years, as shown previously.

You have to remember that the PPC processors are not meant to provide
instructions with direct access to memory, they use registers instead.
Asside from that it would seem that a PPC chip would be competitive.
It would take 3 cycles to do the multiply/add and the pointer updates
could be done concurrently. Add one cycle if you have to do the
updates after the mul/add. All this is based on my limited knowledge.
I really suck at optimizing instruction schedualling.

It doesn't state which brand of Quadra was used. I will also assume that the Mac/PC versions where using compiler C code and the Falcon was running hand coded DSP assembler? Still, if we assume that the 6100/66 is about twice as fast as the 486, then it still has the Falcon beat.

>Because many of the games programmers broke good-programming rules,

Have to agree with you here. Games should be allowed to use whatever hardware tricks they need to make a good game. Word processors, on the other hand, should almost never break.

>What distortion? I showed benchmark completion times for four systems
>including the Falcon, claiming that an efficient architecture and an

That was a Quadra. We have PPCs now.

I thought the C64 was going to be release in China. Does anyone who is going to do the production? It would seem like a Chinese company could, the C64 not being cutting edge or anything.

Distribution:

: best of my knowledge, Commodore hasn't licensed production of the 64
: to another company, but Atari *has* licensed production of the Falcon
: to C-Lab.

Escom bought Commodore's assets and plans to (if this ever pans
out) rerelease Amigas and Commodore 64 computers. I think the C64
machines are in countries like China though.

I thought this was a Falcon debate. I like how you defer this to the PC when
you know that the Falcon is not expnadable compared to the Mac 630 line. Apple
has a broad line with other expanadable Macs like 7000 PCI line.

Now that he's got a good head of steam up, James Wood (jamesw@PEAK.ORG)
continues to expostulate with:

: On 22 Oct 1995, George Crissman - Ferran Scientific wrote:

: Am I to infer that the point of the above is to tell me that the 16Mhz
: Falcon has more horsepower than the above systems???

On a system basis, and with respect to the benchmark that was run, yes.

: > : games,
: >
: > That's what Jaguars and Clones are for. (I've never met anyone who
: > felt the Mac was a serious contender in the game machine category. :-)

: Then what's the Atari for? If I have to get a Clone, I may as well do my
: word processing, etc on it as well.

The Falcon is for multimedia, sound, graphics, animation, plus the same
old applications of word processing, data basing, spread sheeting,
telecommunicating, compiling, faxing, etc.

: > That's what "compatibility" is all about! Software written for
: > the ST runs just fine on the Falcon. Are you implying that each
: > new MacIntosh model causes the existing catalog of Mac software to
: > become obsolete?

: Then why won't all the games run on the Falcon? There should be no
: exceptions. "Compatibility" is an absolute term.

Because many of the games programmers broke good-programming rules,
doing hardware-specific tricks. Software is more than games, and an
80% compatibility is quite good.

: > : > 2. Because the Falcon is still being actively marketed.
: > : What continent?
: >
: > Europe, United States, etc.

: No, not in the United States.

Yup, right here in the US. Check in ST Informer. And on the Toad Web page.

: > Try to buy new software for it in four years. Most likely, your machine
: > won't be capable of running it. Most of the new Atari software runs on
: > the ST just fine.

: Things are going to dry up faster, though. No Codehead, etc....

Software companies come and go. New software is still coming out
for the Falcon.

: True - but let's not justify our opinions by distorting the truth with
: ridiculous claims that the Falcon outperforms all other plaforms,

What distortion? I showed benchmark completion times for four systems
including the Falcon, claiming that an efficient architecture and an
efficient operating system can outperform an inefficient system running
with a higher clock speed.

: that we can get lots of new software,

Right there in the Toad catalog & ST Informer.

: that we can run all old software (games included) on the Falcon,

My claim has been 80% compatibility with existing ST software. Are
you experiencing comprehension problems?

: that the Falcon is a great starter computer,

It's a great computer!

: that the Falcon can be all things to all people,

When have I ever said that?

: that 8 years from now things will be peachy with the Falcon.

I said that new Falcon software released eight years from now will
most likely run on today's Falcon, given the fact that new software
released today runs just fine on an 8-year-old ST.

: 8 years ago you could get new software for the Commodore 64. Does
: that mean I can now or in 8 years?

Well, you could have a year or so ago, before Commodore went bankrupt,
because the 64 was then still available for sale in toy stores. To the
best of my knowledge, Commodore hasn't licensed production of the 64
to another company, but Atari *has* licensed production of the Falcon
to C-Lab.

: James

Keep trying, James. And try to stick to the point.

Not the Falcon version which supports the DSP for varous tasks. AFAIK, the Mac version relies on external audio hardware by Yamaha, as the PC version does. Digital Audio with 16 tracks (hence the "16" in the name) is possible with a stock Falcon030. You can't beat the value for money of the Falcon in that special niche.

Wait -- Brian Quinlan asked you to provide an example of something that a DSP
can do that a PPC cannot. Are you implying that a PPC cannot multiply, add,
do memory loads and pointer updates? Yes, it may take more cycles, but the
argument was that the PPC can do everything that a DSP can do. The argument
was also that, since the PPC is running at a much faster data rate and has a
wider path to memory, it can do everything the DSP in the Falcon can do at
at least the same speed.

Not. Netscape is a commercial product. As suggested, call Netscape. This
is one of the reasons why Netscape is rapidly becoming one of the largest
software houses, due to their distribution, but it is still NOT free.
If you pay the cost or not, that is your problem, but the product costs
$40 or somesuch.

I sold my Performa 550 for $900..I called MacWarehouse to order the P636 for $999. I than bought a Apple display color monitor, the sony tube one for $230 with shipping. My tottal upgrade cost was $332. For $332 I received the 040-33mhz, 3 extra mb of ram and an extra 90mb of hd space plus lots of expandability!

But we have the diversity of choices that the Falcon will never have. The
Falcon is underpowered non expanadable and over priced! Thats the fact Jack!

>

The Falcon is a lousy multimedia platform because the hardware is slow and weak by 1995 standards plus their is almost no apps that is considered multimedia.

You brought up something that I hadn't though of: the DSP would be bound by
the memory subsystem. How big is the bus to the Falcon DSP and what kind
of data throughput is possible? Does the Falcon use some sort of cacheing
mechanism? Maybe L2 cache for the DSP?

That was not a good point to concede. Few people, I would say only the
K-mart market, would buy a P5-60 these days. So the mean PC being sold
today is more powerful than the Falcon.

>Like the available slot for the 68882 math coprocessor.

The copressor slot would be unnescessary if Atari had them built-in.
Upgrading to 14 Megs of RAM is much less than the 72MB that a low-end
PC/Mac can be expanded to. A PDS slot is cool but Apple has used that
for years. And then your missing an expansion bus such as PCI.

>And BTW -- since *you* are a member of the vast Personal Computer public

>For "home" use, I can't beat the Falcon.

Why would I output the video to a 720dpi printer? It will look like crap
just like it would outputed from a Falcon. The Mac video capture hardware
is limited to the quality of the input data as is the Falcon's. If you
capture a frame, at a reasonable size and frame rate then all the data
for that frame will be there. I've never tried to make a broadcast system
before so I can't comment on your price figures. Doesn't seem that
bad though assuming that it includes everything.

However, a PC today that's more powerful will cost less.....MUCH LESS.
The scenario isn't complete without saying it. Look at the November '95
Computer Shopper. Cover story is about 486DX4/100Mhz systems for $999.
All had 8 MB RAM, 256K cache, 540MB hard drives, 1024x768 non-interlaced
video on a .28 dot pitch SVGA monitor, 16-bit sound and QUAD speed CD-ROMs.
Before making judgement, keep this under consideration because it would
cost a hell of a lot more to get a proprietary system up to these
specs...and cost a lot more.

What was that about people bitching about having to pay $2500-$5000 to
upgrade "every year?"

> Are you having difficulty following the discussion?

I know you're not claiming that you can't get any. You wouldn't admit it even if you could get ZILCH. THe fact is that you're trying to pretend that the vast software empire of the PC is NO advantage to the platform, and that proves what a fool you are and how utterly misconstrued your thoughts are on computers. Do you have difficulty understanding that?

>

> cations programs.

And a whole lot of other diverse programs for just about anything you
could possibly want to do from MIDI to burning EPROMS to calculating
vectors and statisitics and learning foreing languages and printing color
automaps and etc and etc and etc. Face it, you've lost this point.

> Most computer users will only operate six or fewer programs on their
> computer. It doesn't matter that there are 237 different word processors,
> since they only need one of them.

1) terminal program
2) database
3) spreadsheet
4) word processor
5) MIDI sequencer
6) File/disk utilities
7) compression utilities
8) Graphics file editors
9) Printer utilities/programs
etc etc etc
How about game 1, game2.......game 20.

Heh heh heh. Looks like you've lost another point.

> Software is available on-line, by mail, and at dealers supporting
> Atari computers.

The former two sources are available to all platforms and the latter is a
joke...practically nonexistant.

>

> Obviously the list is not complete, which means that games
> compatibility will be greater than 20%.

What is OBVIOUS (if anything) is that if they "tested" more and found out
they don't work, they'd have a harder time unloading that backstock of
overpriced Falcons that keeps their overhead up. They can probably try
to reclaim some of their lost fortune by keeping it under their hats and
selling Falcons to people like you who are going to give them the benefit

of the doubt and believe 80%. Why in the hell else would any respectable dealer NOT test the games? They should realize that whether or not it runs on the Falcon should be the BURNING QUESTION on all Atari owners minds. Why don't they find out and inform?

>
> Also: 75% of all games sold in the US are for the various Clone machines.
> If you're looking for a game machine and not a serious computer, then the
> Falcon is obviously not for you.

Just because you can't get many games doesn't make your computer a "serious" one. Just because you CAN get a lot of games doesn't make your computer "less serious." Now you sound like what the IBM guys said about my Atari 800 back in 1980 when it was a KICK ASS "serious" computer and played the best games. Just so happens "serious" computers play the best games because they have the highest demands on the hardware. I don't expect you'd understand that, however.

>
> BTW -- I was referring to all existing ST software in the
> "80% compatibility" statement, not just the games.

Ok...that's because most games won't run. HOwever, I can run most of that other software the GEMulator board, stuck in a slot of that $999 100Mhz PC (see Computer SHopper Nov 95) and run it faster and better and cheaper than a $1900 Falcon, and do a hell of a lot else too, plus play games. You don't like that thought, no doubt, but it's true.

> A maxed-out Clone at Incredible Universe retails for $3,000.00. A
> maxed-out Falcon retails for $1,900.00. Nope, I don't think you
> could buy BOTH a MAC and a Clone. You couldn't even buy just the
> clone.

A maxed-out clone is orders of magnitude beyond what a Falcon is capable of and the comparison is ludicrous. A $999 clone runs RINGS around a Falcon. Incidentally, on page 23 (ABS Computer) there's a $1839 clone ($61 less than your "maxed out" Falcon and here are the specs:

Pentium 100Mhz
16MB RAM, 256K cache
850MB IDE drive
PCI Local bus
SVGA
Quad-speed CD-ROM
16-bit sound and speakers
14.4K fax/modem
15" non-interlaced flatscreen monitor

Good lord, man.....look at those specs for less than your $1900. Learn to give up on this insane arguement and be thought of as a fool than to continue to pipe up about that which you know nothing - and remove all doubt.

>
> Check out the Jaguar ads on the late-night talk shows.

Which is why their marketing is so ineffective. I don't even see their
ads in the video game magazines, which is what the kids (and adults) read
who are in the market. The kids don't watch late-night talk shows!!
Atari's too cheap to get prime-time.... THey're going to lose that way.

> : Now we revert to the "we already have it so we don't need more"
> : arguement.
>
> No. It's a statement that new software is available for the

Yeah, right...In the hands of Atari. In the real world, benchmarks would
be quite different as anyone who understands anything about computers
(read: not you) would have to agree.

> WANTING to upgrade is different from being FORCED to upgrade, a
> requirement of running with the Clones.

I know people with 286's and 386's that still get by. When were they forced?

>
> Yes, there are hardware upgrades for the Falcon -- the upcoming '040
> processor, the 32 MHz upgrade, the expose video board, etc.

You're just getting to the 040 as Apple phases it out after years of
production....you have a lot to look foreward to. Same with 32Mhz.

> : the wayside like the Atari 8-bit, Apple II, Coleco Adam, Commodore

>
> Wrong again.

Uh....I meant the ATARI Falcon, so I'm, not wrong.

> It all comes down to: how much does it cost to perform the task?
> Clone users spend about $2500.00 every four years while Atari owners
> spend about $2500.00 every eight years, as shown previously.

This is laughable. Your $2500 is supposition while I've shown you FACT (Computer Shopper, NOV 95) as my PROOF. You stand corrected. $999 for a 100Mhz PC with more bells and whistles than any Falcon could dream of, and more software and horsepower too.

I have no problems admiting this. But, the reason for my post was to point out the foolishness of comparing a machine built today to a machine that was built three years ago.

I may have a bad memory, but I belive three years ago, a "standard" PC would have been at most a 486/33. I personally belive that the Falcon can hold its own against that machine.

There are also upgrade kits for the Falcon that increase speed of the processor, and other stuff..

The Amiga is a good machine, but

a) it's out of date now.
b) Hard to find
C) It's manufacturer is bankrupt.

The Amiga (like the Atari ST) was an excellent computer that
never really caught on too well in North America. It can emulate other
computers, but that is expensive to do and it wouldn't be able to keep up
with the latest in PC and MAC hardware or software.

Some versions do. The 040LC does not but all the others do (EC,MC,etc) I
beleive.

>This leaves us perched on the edge of the "efficient software is small
>software" discussion, BTW.

Software may be small on the Falcon but unless they do something clever
then the data takes the same about of RAM space. And if you want a lot
of RAM then either your doing a lot of LISP programming or you need
it for data.

>The processor direct slot (PDS, right?) serves as the expansion bus,
>although I will admit it's limited to one plug-in.

I'm saying the Apple has PDS & SCSI. So the Mac sacrifices a cartridge port
for several PCI slots.

So this is a rule based on the speed at which the operating system runs and
not some weird archetual superiority of the Falcon. Cool. But remeber that
the Mac operating system has to do a lot more stuff than the Atari. How
many pixels in the LCIIs monitor vs theSTs. What pbt depth was the LCII
running in? Was the LCII networked, file shared? What font system was the
Atari using? Etc. I think we've had this debate before.

James,
You make some very good points. However, please don't make bold claims about the Falcon when you just do not know what you are talking about. For example, you should probably own and use a Falcon to get an idea of how compatible it is with old software. 80% sounds reasonable to me. Games run over half of the time. All the games you sold me worked just fine, thanks :-).
I agree that the PC system that you are talking about (CS) sounds very impressive. However, I have seen other's impressive PCs choke on installing 3 year old games due to lack of memory (this system had 16 megs). Sure, I could learn to use a PC more effeceintly but why should I have to when I enjoy my Falcon and find it much easier-to-use? I believe that a little while back you were saying how great the ST was and how difficult it was to use an IBM. Why the change of heart, if you don't mind me asking?
Anyway, you could argue that I am biased and brand loyal to Ataris. Fine. I just like the machine. I enjoy using it. I see all the trials that PC users go through and don't want to jump through the same hoops to get programs to run. I also, out of principle, do not want to run anything from Microsoft on my home computer.
I am not going to try to argue that the Atari can compete with an IBM in raw computing power at the same price. I would argue, though, that TOS 4.04 completely kills anything that runs on the PC. In that respect, the Atari wins. This is something that will not show up in benchmarks.
I am also from the old days of computing when people used their systems for fun and leisure. The Falcon is not merely a tool for me; it is a form of entertainment. I enjoy using it. Will C-Lab take the market by storm with Falcon clones? Most likely not. They will, however, ensure a supply of good, fun computing systems for hobbyists like myself. It also gives people choice.
Glad you enjoy your PC. Oh, and could you stop laughing in your posts? I find that unneccessary and annoying.

What ? You say that the 630-line is more expanable than the Falcon ?

That's a BIG joke! My father has an LC630 Mac running MagiCMac, and that machine
has ONLY ONE PDS-slot and it can only take one card!! Baaaaaaa....

On the Falcon you can add accelerator cards on the expansion slot and than add
additional cards on top.

On the LC630 you can't connect a new IDE harddisk, because it has to be
modified specifically for the Mac - BIG bummer, since those external SCSI-harddrives
are EXSPENSIVE.

On the Falcon one can add two IDE drives with NO PROBLEMS!
Of course it also has a SCSI-II slot, but I assume you already know that.

My father has big problems using his CANON BJ-200 with PowerPrint on the Mac, don't
say the Mac doesn't have it's drawbacks - 'cause it certainly has some!!

- And still no cheap D2D-option...

Keep Cool and Flying...

What do you exspect from a 10-year old computer ??

Take a 10-year old Mac - Now that's a pathetic machine, not even 16 color modes.

> Don't need a graphics board. I have one meg video memory as standard..

Like my Falcon. I have 4 MB ST-Ram (video-Ram) and 4 MB FastRAM - works great.
Of course the ST-Ram can also be used as user-Ram, since the screen usually
doesn't take up all the ST-Ram, unless I use virtual screens etc.etc.

In what way? Fact: the fastest Falcon is a 16 mhz. 030, costs $1349 without monitor and is behind the curve. Plus very little Falcon specific software.

: >built-in, just like the '486's? The rumored C-Lab Falcon040 would then
: >have the math coprocessor standard. Ummmmm!

: Some versions do. The 040LC does not but all the others do (EC,MC,etc) I
: beleive.

Something to look forward to!

: >This leaves us perched on the edge of the "efficient software is small
: >software" discussion, BTW.

: Software may be small on the Falcon but unless they do something clever
: then the data takes the same about of RAM space. And if you want a lot
: of RAM then either your doing a lot of LISP programming or you need
: it for data.

True, data takes the same amount of space, no matter which platform
you choose. For many of the day-to-day computer tasks, however, the
size of the application program is larger than the data file. That
makes compact applications pretty important.

: >I dunno ... Peter sounds like a plugged-in guy to me. I wouldn't be
: >surprised to see him as a guest speaker at some big Mac powwow somewhere.
: >(I'd like to see someone post the "transcript" of any such speech he
: >might give. Any creative writers out there?)

: Peter doesn't speak for anyone Mac users that I know of! Every time I
: see one of his posts I want to buy a PC!

You're right, it's unfair of me to automatically assume all Mac users
are like Peter. I apologize for generalizing.

: >: I don't like your rule of thumb. Please explain how you came up with it.

: >It's my own rule of thumb, but it seems to hold true with other models
: >in the Mac line as well, and appears to be caused by inefficiencies in

: >the Mac operating system.

: So this is a rule based on the speed at which the operating system runs and
: not some weird archetual superiority of the Falcon. Cool. But remeber that
: the Mac operating system has to do a lot more stuff than the Atari. How
: many pixels in the LCIIs monitor vs theSTs. What pbt depth was the LCII
: running in? Was the LCII networked, file shared? What font system was the
: Atari using? Etc. I think we've had this debate before.

Most likely we _have_ had this debate before. Both systems were running
"as turned on", all by themselves, without any special setups or auto
folder programs.

The key point is: "..the Mac operating system has to do a lot more
stuff...." Now we're talking efficiency again....

: your ridiculous claims.

Sorry. "Expostulate" appeared to be the appropriate word.
I'll try harder to use smaller words.

: > : Am I to infer that the point of the above is to tell me that the 16Mhz
: > : Falcon has more horsepower than the above systems???
: >
: > On a system basis, and with respect to the benchmark that was run, yes.

: "On a system basis" tells me nothing.

It means "the whole computing system" and not "just the processor".

: With respect to that benchmark? That benchmark was obviously an
: inaccurate way to measure performance. Atari just so happens to blow
: away all these other platforms when THEY run the test on the
: Falcon...yeah. Let me se an independent testing house reproduce the
: results. Alas, it'll never happen because they haven't time to waste
: with toys.

Digital Equipment Corporation ran the benchmark on the Quadra, the
'486, and the Alpha. Atari Corporation ran the benchmark on the
Falcon. The purpose of the benchmark is to allow comparison of
dissimilar systems.

: > The Falcon is for multimedia, sound, graphics, animation, plus the same
: > old applications of word processing, data basing, spread sheeting,
: > telecommunicating, compiling, faxing, etc.

: That's true....but the clone will do all that faster,

... if it's running 75 MHz or faster ...

: do more, and costs less. That's all I'm asking you to concede.

In a separate posting, you suggested a $999.00 '486. But after it
was equipped with the missing Falcon hardware, it cost *more* than
the Falcon.

: > : Then why won't all the games run on the Falcon? There should be no
: > : exceptions. "Compatibility" is an absolute term.
: >
: > Because many of the games programmers broke good-programming rules,
: > doing hardware-specific tricks. Software is more than games, and an
: > 80% compatibility is quite good.

: Not if your favorite wares are in the damned 20 percent.

I'm sorry that the Falcon won't run your favorite software. I'm
glad that you do have a computer that will run your favorite software.

: > : > : > 2. Because the Falcon is still being actively marketed.
: > : > : What continent?
: > : >
: > : > Europe, United States, etc.
: >
: > : No, not in the United States.
: >
: > Yup, right here in the US. Check in ST Informer. And on the Toad
: > Web page.

: That's why it's ridiculous to believe that the platform should attract
: new customers. They only preach to the converted. The user base won't
: grow, merely what few people remain "loyal" to the line may upgrade or
: get 2nd machines. This is different from attracting new customers, which
: is what "marketing" generally means.

There is "mass" marketing (which means everybody) and there is
"targeted" marketing (which means concentrating on likely buyers).
Yes, the Falcon is still being actively marketed to those people
most likely to buy a Falcon: musicians and existing Atari owners.

: > Software companies come and go. New software is still coming out
: > for the Falcon.

: "Software companies come and go" is a very general, multifaceted
: arguement that could be debated at great length. What is a very
: specific, undebatable statement is that many of the best (again, Codehead
: for example) are on the way out. Why? The market is too small. Why else?

Just because established software companies are leaving doesn't
mean that the new software companies are not capable.

: > : True - but let's not justify our opinions by distorting the truth with
: > : ridiculous claims that the Falcon outperforms all other plaforms,
: >
: > What distortion? I showed benchmark completion times for four systems
: > including the Falcon, claiming that an efficient architecture and an
: > efficient operating system can outperform an inefficient system running
: > with a higher clock speed.

: Maybe if we had 17Mhz systems compared to your 16. However, we're
: talking about MULTIPLES of your clock speed. The circumstances under

: which the benchmark times were run is not known. If someone wants to
: turn the cache off on a DX2/66, they could do so (and not tell you) and
: they could publish such times. I'm not saying that they did, but the
: circumstances under which **ANY**of the benchmarks were run and specific
: hardware would have to be known for the numbers to have any meaning. The
: point is that benchmark times can be engineered to go in whatever
: direction the benchmarker wants them to go in.

This is a very good point. A benchmark routine is supposed to make
the best use of the hardware for fastest execution time, and the
possibility that DEC "fudged" the Quadra and '486 routines *does*
exist.

: What about true-color
: graphic manipulation? Disk benchmarking? What hardware are we to run on
: the PC? There are myriad factors to be considered, non of which were
: considered in that specious benchmark that claims the ridiculous.

I can't give further details because I do not have further details.

: > My claim has been 80% compatibility with existing ST software. Are
: > you experiencing comprehension problems?

: No, I think you are full of crap. Last time when I looked in the Toad
: Catalog, there were only a handful of games that were "approved" for the
: Falcon. What about the TT?

Maybe there will be more checkmarks in the updated catalog that is
supposed to be coming out. And the 80% compatibility includes applications
such as word processing, spread sheeting, data basing, etc. Limiting the
comptability question to games is not reasonable.

The TT was designed to be a high-end workstation using Calamus
Desk Top Publishing and other heavy-duty applications.

: > : that the Falcon can be all things to all people,
: >
: > When have I ever said that?

: Heh. You said that it outperforms the other platforms for less money.
: Can you recall? I now put the question to you: Are YOU having
: comprehension problems? You're certainly having logic problems.

The problem we're having here is that you misrepresent my comments.
(See below for an example.) Nope, no comprehension problems.
Nope, no logic problems.

: > : that 8 years from now things will be peachy with the Falcon.
: >
: > I said that new Falcon software released eight years from now will
: > most likely run on today's Falcon, given the fact that new software
: > released today runs just fine on an 8-year-old ST.

: If you think there's going to be a significant amount of Falcon software
: in 8 years, you're crazy. Hell, we'll probably all toss our PCs into the
: shitbox and be running some symmetric multiprocessing RISC thing...

More Falcon software is being developed and announced. It'll be
fun to see what's next.

: > Keep trying, James. And try to stick to the point.

: I don't even have to try to get mud in your eye, buddy.
: James

Is that really the point?

: No dill-weed... I mean that you can't get the DIVERSITY (the grapes).
: Heh heh. I'll try to refrain from such complex (snicker) analogies so
: you won't get thrown off again.

I get it! Like the sign at the zoo's croc pond:
"Do not feed the allegory."

: And a whole lot of other diverse programs for just about anything you
: could possibly want to do from MIDI

... an Atari strong point ...

: to burning EPROMS

... some EPROM burners require only a terminal program, something
easily available on the Atari ...

: to calculating vectors

"Master CAD is a three-dimensional designing tool. The structured
interface lets you control the variables and parameters, select
the best view to work from, define the projection planes, and build
any object you want. Auto-dimensioning lets you calculate exact
distances between points in a drawing." From the International TOS
Software Catalog.

: and statistics

such as spreadsheets (we've got 'em) and data bases (we've got 'em)

: and learning foreign languages

"French Mistress: This program is a valuable aid to learning
French. It contains a tuition-control program and a comprehensive
series of lessons, each covering a different subject in vocabulary
or grammar. The program is suitable for beginners, travellers, business
people, and advanced students." From the International TOS Software
catalog.

: and printing color automaps

I must admit I haven't seen *this* application on any computer.

: Face it, you've lost this point.

Nope.

: > Most computer users will only operate six or fewer programs on their
: > computer. It doesn't matter that there are 237 different word
: > processors, since they only need one of them.

: 1) terminal program
: 2) database
: 3) spreadsheet
: 4) word processor
: 5) MIDI sequencer
: 6) File/disk utilities
: 7) compression utilities
: 8) Graphics file editors
: 9) Printer utilities/programs
: etc etc etc
: How about game 1, game2.......game 20.

: Heh heh heh. Looks like you've lost another point.

Hmmmm. I will concede that I hadn't considered "utilities"
to be "programs". I'll concede this point.

: > Software is available on-line, by mail, and at dealers supporting
: > Atari computers.

: The former two sources are available to all platforms and the latter is a
: joke...practically nonexistant.

You said that software wasn't available. I showed that it was.

: > Did you see the little note in the upper right corner? It says:
: > "A check next to a title means it has been tested on and is
: > compatible with the Falcon030. Other titles have not been tested
: > or do not work...." ^^^^^^^^^^^^^^^^^^^
: >
: > Obviously the list is not complete, which means that games
: > compatibility will be greater than 20%.

: What is OBVIOUS (if anything) is that if they "tested" more and found out
: they don't work, they'd have a harder time unloading that backstock of
: overpriced Falcons that keeps their overhead up. They can probably try
: to reclaim some of their lost fortune by keeping it under their hats and
: selling Falcons to people like you who are going to give them the benefit
: of the doubt and believe 80%. Why in the hell else would any respectable
: dealer NOT test the games?

Lack of time to do everything necessary? It takes a lot of work to
keep a business running.

: They should realize that whether or not it
: runs on the Falcon should be the BURNING QUESTION on all Atari owners
: minds. Why don't they find out and inform?

Ask before you buy. And if they don't know, don't buy it. My dealings
with Toad have been very positive, and I just don't accept your claim
they are trying to unload non-working software on Atari users.

Unless you have proof of your allegation, you owe Toad a public apology.

: > Also: 75% of all games sold in the US are for the various Clone
: > machines. If you're looking for a game machine and not a serious
: > computer, then the Falcon is obviously not for you.

: Just because you can't get many games doesn't make your computer a
: "serious" one. Just because you CAN get a lot of games doesn't make your
: computer "less serious." Now you sound like what the IBM guys said about
: my Atari 800 back in 1980 when it was a KICK ASS "serious" computer and
: played the best games. Just so happens "serious" computers play the best
: games because they have the highest demands on the hardware. I don't
: expect you'd understand that, however.

It was always an eye-opener for the owner of an original IBM PC or XT
to discover that the Apple][and Atari 800 ran benchmarks faster than
their machine. It was a question of efficiency, something the IBM was

sorely lacking.

And the best games are on the next-generation consoles, such as the
3D0, the Saturn, the Playstation, and the Jaguar. The clones are
being left behind by less expensive machines again.

: > BTW -- I was referring to all existing ST software in the
: > "80% compatibility" statement, not just the games.

: Ok...that's because most games won't run. HOwever, I can run most of
: that other software the GEMulator board, stuck in a slot of that $999
: 100Mhz PC (see Computer SHopper Nov 95) and run it faster and better and
: cheaper than a $1900 Falcon, and do a hell of a lot else too, plus play
: games. You don't like that thought, no doubt, but it's true.

That $999.00 computer costs $100.00 MORE once equipped with all the
Falcon hardware, as shown in a prior posting. And the biggest drawback
to the clone is that it's of such low quality that it won't last very
long. Just this week, for example, a nine-month-old Packard Bell
(cost $2,000.00) had to go into the shop for a motherboard replacement.
No, I don't like the thought of using a PClone in the place of a Falcon.

: Pentium 100Mhz
: 16MB RAM, 256K cache
: 850MB IDE drive
: PCI Local bus
: SVGA
: Quad-speed CD-ROM
: 16-bit sound and speakers
: 14.4K fax/modem
: 15" non-interlaced flatscreen monitor

: Good lord, man.....look at those specs for less than your $1900. Learn
: to give up on this insane arguement and be thought of as a fool than to
: continue to pipe up about that which you know nothing - and remove all
: doubt.

Look at the previous posting and see all the Falcon stuff that
your system DOESN'T HAVE. Add the Falcon stuff in. Notice that
your clone system is now more expensive than the Falcon.

: > Check out the Jaguar ads on the late-night talk shows.

: Which is why their marketing is so ineffective. I don't even see their
: ads in the video game magazines, which is what the kids (and adults) read
: who are in the market. The kids don't watch late-night talk shows!!
: Atari's too cheap to get prime-time.... THey're going to lose that way.

Kids aren't going to pay $200 - $400 for a video game system. The
parents are the ones with that kind of money. And there are Jaguar
ads in the video game magazines.

: > : Now we revert to the "we already have it so we don't need more"
: > : arguement.

: >
: > No. It's a statement that new software is available for the
: > Falcon, and that it's of leading edge concept and quality.
: > Is English a second language for you?

: Yes, what little of it there is. English isn't a second language; please
: don't erroneously assume that because others disagree with your assinine
: assertions that it is because they cannot understand....it is because
: they disagree.

We can agree to disagree.

: Yeah, right....that 100Mhz Pentium with 16 Megs and 4x CD-ROM...made look
: bad by a 16Mhz 030 !!!! HA HA HA HA!!!! The only thing looking bad here
: is you. Get wise and give it up.

What's bad is that the Pentium *needs* 100 MHz and 16 Megs to outdo the
Falcon with it's 16 MHz '030.

: > That so-called "Dead End hardware" smoked an Apple Mac Quadra and had
: > a 66 MHz '486 breathing heavy just trying to keep up. An efficient
: > architecture coupled with an efficient operating system outplays raw
: > Hertz.

: Yeah, right...In the hands of Atari. In the real world, benchmarks would
: be quite different as anyone who understands anything about computers
: (read: not you) would have to agree.

People who write benchmark programs write them to exploit the total
power of the machine. And no two people write programs the same way.
What we do know is: at a real-world trade show, the Falcon ran the
benchmark faster than the Apple Mac Quadra, a '486 @ 66 MHz, and the
(then) new DEC Alpha system.

: > Falcon: STILL In Production
: > Atari 8: Not In Production
: > Apple II: Not In Production
: > Coleco Adam: Not In Production
: > Commodore 64: Not In Production
: >
: > Wrong again.

: Uh....I meant the ATARI Falcon, so I'm, not wrong.

Splitting hairs, now? Many people with PClone computers, when asked,
will say "My computer's an IBM", even when it's a Dell, an HP, or a
Gateway 2000. It's fair to call it an "Atari" Falcon, even though
it's being built by C-Lab.

: > It all comes down to: how much does it cost to perform the task?
: > Clone users spend about $2500.00 every four years while Atari owners
: > spend about $2500.00 every eight years, as shown previously.

: This is laughable. Your $2500 is supposition while I've shown you FACT
: (Computer Shopper, NOV 95) as my PROOF. You stand corrected. $999 for a
: 100Mhz PC with more bells and whistles than any Falcon could dream of,
: and more software and horsepower too.

Your $999.00 computer costs $100.00 more than a Falcon when equipped
with standard Falcon hardware.

But any platform is fine for most day-to-day tasks. It's when you are
doing something intensive that you need better than a 1040ST and then
you also might need a lot of RAM for data.

>The key point is: "..the Mac operating system has to do a lot more
>stuff...." Now we're talking efficiency again....

In a way. For example, the Mac operating system uses True Type fonts for
Chicago and Geneva. Mathematically generating the two most used fonts
on the Mac takes a lot more power than using BitMaped fonts. When you
turn your Mac on for the first time it's in 32000 color mode. That
requires more power than 256 color mode. Etc.

What he was saying is that it should already have a coprocessor, making the socket unnecessary.

>A proprietary bus from a non-compatible platform? The Falcon has
>a SCSI-II port to use as a bus. Wrong!

PCI is not a propriety bus! And PC PCI cards work fine in the Mac so long as the manufacurer writes a Mac driver. And SCSI-II is way too slow for some types of expansion.

> here

I don't understand the point you are trying to make here. I have been
throwing together "generic" PC computers for a time (who hasn't?) and
rarely encounter these hypothetical problems. Nevertheless, if you have
a question about what you are getting, then see the article in the
November 1995 Computer Shopper. The questions you asked were answered,
for whatever it's worth. The point of your question appears to be to
invalidate the point I was making - the tremendous value of these
systems, which still stands. Sure, a Gateway 2000 with pipeline-burst
cache and EDO RAM is nice, but it does cost more. That doesn't mean the
$999 system is junk. They come with a warranty and are made with
brand-name components.

While you're criticizing quality, let's not forget that you never know
what's inside the Atari. I remember having all different mixes of drive
mechanisms, revisions of motherboards, etc in my STs. I remember one
Atari would have Chinon drives with glued-on heads that come loose, and

the next would have a decent mechanism. Whatever was cheapest at the time of assembly. When I order a SC1224 monitor, will I get the chapest Goldstar or Daewoo model with a Fuji glued to it? I'd say that is where your questions should lie. (The first SC1224s by JVC were kick-ass, IMO).

> Certainly not something that would run OS/2 or Win95, or even Linux!

I'm sure they would run whatever OS you choose...why wouldn't they? It's insane to say that they wouldn't run Win95....anything will run Win95. They either work or they don't and if they don't they're going back. IF they work, they'll run whatever you want. I don't understand this arguement. You don't need a fault-tolerant RAID system to run those operating systems.

> Money doesn't mean everything, but you get what you pay for. A quality system
> to duplicate what the latest Falcon can do (say a MarkII) would cost you at
> least as much and probably more (I know an equivalent Mac would be twice as
> much) and then there's the software to do what you want. Only Amiga is
> equivalent as far as I can see.

I disagree, and I challenge you to prove your point about a Falcon Mark II (I'd like to know what that is) being the same price or cheaper than an equivalent PC or Mac. You tell us the exacting specifications of this system and price, and cite your source of information. I will look up the price of competing PC systems twice - once for the "el cheapo" clone and the other for a quality system like a Gateway. I'll be surprised if you come out on top, but I am willing to put it through the test. I will even cite the page numbers and issue of Computer Shopper from which I get my information. I'm sure Sinclair can propose a competing Macintosh computer and provide us with a source for his information. Let's not argue - let's get to the resolution of this by starting with the Falcon system you speak of.

> I use a 100MHz Pentium with 16MB ram at work running Win3.1 and CorelDraw, and
> it is my experience that my Falcon with 4MB ram is just as fast(if not
> faster[depending on software]), more stable, and I can get more done on it
> (and enjoy it).

The "and enjoy it" part gives it away. You guys can't remain free from emotional obsession in this arguement. Face it - because you "enjoy" your Falcon, you are biased against the 100Mhz Pentium. That's OK - I'm not asking anyone to go buy a PC. However, I do ask that they realize their bias and that it does look ridiculous to anyone with an impartial viewpoint that they maintain that their 16Mhz 68030 is faster than a 100Mhz Pentium. Just realize that impartiality and empiricism is over here, and you're waaaaaaay over there. That's all. You can still enjoy yourself. Same with "can get more done on it." How can you get more done on any one computer than another? The only think I can reckon is that the computer with the most horsepower and software can get more done. We both know which one that is (and isn't), don't we?

> No intel chip machine that I know of can do so well, the
> PowerPC is the only general machine that is _better_ (whatever that means,
> faster I suppose). this is leaving stuff like SiliconGraphics workstations out
> of it, OK?

The Power PC is looking better all the time. However, I'm going to wait it out one more generation until the Intel dominance (and all the benefits that the large installed base of PCs brings) dies down a little. PCI Macs are just getting out the door, which is excellent. When it gets to the point that there is as much software for the PPC and as the PC (or close) and there are thousands of people making accessory cards for it and hundreds of PPC computer makers competing with each other to drive the price down of a PPC console, my PC goes into the shitbox for good. I assure you. Until then.....

James

At this point, let's just consider the Falcon a 16Mhz 68030. Forget about the fact that it's an Atari for a moment - sorry, there's no magic that will allow it to achieve more than a 16Mhz 68030 will do.

All I can tell you is that if you **really** believe that a 16Mhz 68030 will outperform those other processors (you don't even say what the Quadra was), then you can't be reasoned with. I'm not talking about that STUPID benchmark that you take as proof. How do we know what the benchmark program was? What language was it written in? What routines did it call in the OS? Was it disk-based, processor-based, graphics-based, all three?

I wish I still had access to my stack of BYTE magazines. Perhaps someone else can supply us with the raw processing power of the CPUs - like MIPS, Whetstones, Dhrystones, SPEC92, etc. It's absolutely ridiculous to have to go to such means to convince someone that his LITTLE 16Mhz 68030 is NOT FASTER THAN A DEC ALPHA!!!!! That benchmark is a hoax!!! I'm sure even the Quadra has (1) a superiour 680x0 processor at (2) a higher clock speed....heh..and you still believe that. Have you ever heard of "not believing everything you read?" Especially from Atari. If you had any reasoning ability, you'd think for a moment that a DEC ALPHA is a far cry from your little 16Mhz 68030, but you don't. That's the trouble with people like you....THere's nothing wrong with enjoying your Falcon, but to maintain (through some shady unknown benchmark, the details of which are completely unknown) that YOUR FALCON IS FASTER THAN A DEC ALPHA is nothing short of ignorant and assinine. Before you even believe in that yourself (much less boast about it), you should understand the exacting details of the benchmark and the hows and whys that a 16MHZ 68030 could beat out those upscale processors. You should be able to intelligently debate on the matter, providing the details to support your arguement and the results of the benchmark, to eliminate the possibility of some anomoly, inaccuracy of claim, dishonesty, etc. Can you? This is especially true when the claim is as big as that.....to beat a DEC

ALpha. You'd better be prepared to explain how something like that can occur, or shut up. In science, the key to proving an experiment is that is repeatable. Chances are that you'll say that you don't know of any other benchmarks that were done. Probably because the results aren't repeatable. However, even if we don't have another benchmark, we can contact the manufacturers of the CPUs and obtain their rated performance figures. Although that shouldn't be a completely accurate method of determining which system will be faster, rated performance should lie *somewhere* within the realm of the benchmark. We both know that if we go to the trouble of contacting DEC about the Alpha and Motorola about the 16Mhz 68030, that the 030 is the lesser processor. Now, do I really have to spell it out for you like that?

>
> 256-byte data cache. 256-byte instruction cache. (Source: Atari
> Falcon flyer dated 1992). Wrong!

So there's 512K of cache? Are you claiming this to be L1 or L2? Where is this cache, and in what form of chips? How many nanoseconds are the cache chips rated at?

>
> Falcon RAM can be increased from 1 Megabyte to 4 Megabytes or to
> 14 Megabytes. Wrong!
>

No, not "Wrong!" I didn't say that the Falcon couldn't be expanded. I was simply stating that when you boast of the Falcon's SIMM slots, understand that other computers used SIMMS years before Atari, so I just meant to say that it's not a big deal and certainly no credit to the Atari. I NEVER SAID THE FALCON DIDN'T USE SIMMS, BOZO. Go back and re-read my comments on the matter before you spout "Wrong!" so much.

Incidentally, 1, 4, and 14 megabytes are some lame choices. Seems like I recall the Falcon only using 12 of the 14 megabytes...but I never fully understood the criticism. Yes, this could be "WRONG!" but I acknowledge that in anticipation of an explanation.

> : Like the PCI bus that you don't have.
>
> A proprietary bus from a non-compatible platform? The Falcon has
> a SCSI-II port to use as a bus. Wrong!

Ha ha ha! (yes Tirrell....anyone who calls PCI a proprietary bus from a non-compatible platform deserves laugher whether you like it or not). PCI means Peripheral Component Interconnect and **IS** the new standard. Even the PowerMacs are going to PCI bus. You site a lowly SCSI-II port? How many years have we all had that?

>
> : Like the fact that you can't just drop a 66Mhz or 100Mhz (or 120Mhz) clock-
> : multiplied chip in the same hole as your present one....
>

> The 32 MHz upgrade isn't just a drop-in-the-hole replacement, true.
> But the clock speed can be increased. Wrong!

Put that "Wrong!" where the sun don't shine. You say "True" that it's
not a drop-in-the-hole upgrade, then call me "Wrong!" That is a
dichotomy. Perhaps it illustrates your ongoing predilection in this
thread to eagerly accuse others of being "Wrong!" without understanding
their statements, much less know what you are talking about. So
basically you're up to speed now with a 386/33 from 1989?

>
> You forgot the Localtalk(tm) Network port. Add $100.00

A cheap network card is more like $50. However, Atari would have done
well to omit it from the Falcon since most people don't use it and the
Falcon is so voraciously overpriced with such unused junk.
oh yeah....."Wrong!"

> You forgot the Digital Signal Processor & Port. Add $250.00

Well, deduct the $100 for the 16-bit sound card and add Sound Blaster
ASP for about another $50

> You forgot the SCSI II port. Add $100.00

What for? (Wrong!). I use EIDE CD-ROMS and hard disks.
Add nothing. Wrong!

> You forgot the composite video output. Add $ 50.00

Compisite video sucks and can't display 1024x768.
Add nothing. SVGA video output is superior.

> You forgot the MIDI ports. Add $100.00

Add $25 for a little "dongle" that converts the joystick
port into MIDI ports. Wrong!

> You forgot the stereo microphone input. Add $ 50.00

Even the cheapest PC sound cards have these, and the
stereo ones have stereo inputs. Shows what you
know. Wrong!!! add nothing.

> You forgot the Jaguar-compatible joystick ports. Add $ 50.00
> (that's in addition to the standard joystick ports)

What the hell would anyone want this for? PCs use the best
analog joyticks you could want, like the Flightstick Pro.
Additional joysticks ports aren't worth a penny if the ones
you have support the best. A Gravis gamepad (or clone) will
give me Jag-like control for about $15 at Target (no Jag or Falcon
stuff there, though). I won't include the $15 for the
gamepad since you didn't include the cost of the Jag controller
on your Falcon. PC doesn't need more than one port.
Add nothing. Wrong!!!

> You forgot the operating system Add $179.95
> (Windows 95 Initial Installation) -----------

Wrong!!!! That $999 includes Win 95. Wrong!!
add nothing.

> Total Add-On Cost For Falcon Goodies To '486 Add $879.95
> Plus Cost of '486 $999.99
> -----------
> Sub Total $1,879.94

$999 486 plus $125 in add ons is $1124.
^^^^^^

> Less Quad-Speed CD-ROM Drive (Reveal CDQ100) $ 179.99
> -----------

Why the hell would anyone want to delete the CD-ROM? Just add one to the
Falcon. Then good luck finding discs.

> Grand Total, '486 With Falcon Goodies $1,699.95

No....Grand total with MORE than Falcon goodies...more RAM, more HD, more
speed, CD-ROM (!!!).....$1,124.00

(damn good thing you'll never be a purchasing agent)

>
> C-Lab Falcon Mark II, 4 Meg of RAM,
> 350 Meg Internal Hard Drive $1,349.00
> Color Monitor $ 250.00
> -----------
> Grand Total, Falcon $1,599.00

add 4x CD-ROM 180.00
add external case and power supply/cables 100.00
add 4 more megs of RAM (if you can) 150.00
add 190 megs of hard drive space 100.00
add 32Mhz upgrade (pay someone else, cons. est) 100.00

$2,229.00

Now....even if that's not completely accurate, it's close enough to prove
my point....IT'S ALMOST DOUBLE THE PRICE!!!!! YOU LOSE!!!!
And then there's these things the PC will do:

1) run at 100Mhz
2) L1 and L2 caches
3) on-chip match co-processor
4) open VLB or PCI slots
5) Run 1024x768 non-interlaced hi-color

What amount of money would let your Falcon do that, when it's already
almost twice the price?

>
> Not only does the Falcon cost less to buy, it costs less to
> maintain, as shown previously.

You stand corrected.

>
> : I've given you the specs on the PC - it's $999. Looks like your "maxed
> : out" Falcon is a mere $901 over the price...heh...against a 100Mhz system.
> : I'll wager I could find a Mac for $999 and perhaps we should restate that
> : you could have a Mac and PC for $100 over the cost of a "maxed out"
> : Falcon.
>
> Not if it has similar equipment and power when compared to the Falcon.
>

What do you mean similar equipment and power? I'm talking about
graphics, CPU, and hard disk performance that no Falcon can even
approach, at about half the price. There **IS* no "similar equipment and
power" at any price on the Falcon. You're maxed out at 32Mhz and even
that kludge doesn't help how your 16Mhz motherboard talks to RAM.

>
> I have looked, and learned that the Falcon will cost $100.00 LESS than
> the '486 system you suggested, when equipped with comparable Falcon
> hardware.

Look again; you are grossly misinformed. We can start with the $179 you
try to tack on for Windows (which was included with the $999 PC) and end
with the silly claim that a PC needs Jaguar-compatible joystick ports...heh.

>
> I have already stated previously that I do not believe that I am
> immune to depreciation, and that means I do not believe I'm immune
> to obsolescence, either. What it *does* mean is that I believe you
> should receive several years of service from your machine before

I know what you mean. I am using a Compaq LTE286 portable at this
particular moment, and although it's years old, it sure seems to get the
job done. Guess all PCs don't have to be new to work, eh?

>
> My upgrading choices from the Falcon include the Eagle, the Medusa,
> and the DirecTT. No need to abandon an efficient and capable platform!

Please.....how about some prices for these systems, full-blown with 1 Gig hard drives and 16Megs of RAM and the fastest processors they can put in them...then I'll come up with some Pentium prices and Sinclair can come up with some Mac prices.

James

I'm sure you enjoyed my previous posting, where I proved you wrong and
revealed that in fact your precious Falcon system would cost ALMOST TWICE
as much as the $999 DX4/100, and could NEVER offer the CPU, Graphics, or
disk performance even if it was 10 times the price. Period.

This is another of your specious arguements. The more software, the more
good software there is. The more competition there is between software
manufacturers. While we have Lotus and Microsoft competing to bid
software prices down and quality up, you act like there's no
benefit....Hell, there's no competition in the Atari software scene
anymore, which is terrible for the platform. If you really think that
there i no benefit to having all these software houses in competition,
then you're very dull indeed. Instead of trying to drop little
"quality<>quantity" cliches, try and apply some reasoning to the
situation as I have. The more software produced the better off the user
is. Are you really dumb enough to argue with that?

>

The only Atari strong point anymore, but a task that most platforms in
existance can handle.

True....but it's nice to have it all menu-driven and point and click.
If your software base is big enough, chances are someone will develop one
like that.

We all know that many of the objects you see and use (and drive upon)
were done with AutoCad on a PC. Go to the nearest engineering department
of a university or firm, look and see, then report back to us what you see.

> : and statistics
>

Even ERNST (hardware/garden store) has $11 CD-ROMs to teach French on the
PC. Because it's a CD, there's TONS of actual pronunciation....for $11
and 2 blocks from home.

>
> : and printing color automaps
>

I just type "Anchorage Alaska" and "Miami Florida" and automap will tell
me the quickest, most scenic, etc routs. Where to get services along the
way, where to go, and even print in color on my Stylus Color printer.

> : Face it, you've lost this point.
>
> Nope.

Yes you have. You don't want to even ADMIT that the PC's software base, which even those who hate the PC but possess reasoning power - is a strong point. You are completely unreasonable, man, completely unreasonable. I never said that the Falcon couldn't run a database or teach French. I was simply trying to (within constraints of time and memory) illustrate the large and diverse PC software base that you don't even understand and won't admit is a boon. Instead, you single out a few things I mentioned and mention similar Falcon applications, completely missing the point that the PC software base is LARGE. You can't understand how there's more than one "Automap" program to choose from, and competition between them (and CD-ROM encyclopedias, for example) has put an enormous quantity of software and information in our laps at very reasonable prices. You won't admit this, however, because you are a completely unreasonable person.

>
> Hmmmm. I will concede that I hadn't considered "utilities"
> to be "programs". I'll concede this point.

Ok...so you're not completely unreasonable, but very much so. Haven't you ever heard anyone say "Yeah, PCs suck but they have a lot of software." Even they know there's merit to it. You don't want to give the PC (or any platform other than your Atari) any credit for having any advantages over your Falcon. That is not a very healthy psychiatric position to be in. Nobody here claims that there stuff is perfect. We're just tripping over ourselves here taking on you who believes you have found the answer to computing.....faster than a DEC Alpha and with better high-quality software than a PC - for less than a PC (that is, $2229 is less than $1124). Are you the kind of person who suffers from insecurity? Do you feel the same way about your car and clothes and house and wife as your computer? That is strange.

>
> You said that software wasn't available. I showed that it was.

You won't even concede that the fact that PC (and increasingly, Mac) software can be purchased at nearly every cornerstore and that it's a boon. You mean you wouldn't cheer (if by some miracle) they started carrying Falcon software? You mean if Lotus and Norton entered the Falcon software market, you wouldn't care since you have all the quality software at bargain prices that a Falcon owner could dream of? I think not. Nobody does.

> : of the doubt and believe 80%. Why in the hell else would any respectable
> : dealer NOT test the games?
>
> Lack of time to do everything necessary? It takes a lot of work to
> keep a business running.

How many years has the Falcon been out and they haven't test them? Lack f time? They could damn well do it on a rainy day. Stores are not always busy. Personnell stand around on slow days. You need not defend them with such weak arguements. We all know that it takes a lot of work to keep a business running. However, that doesn't help the fact that it is inexcusable that they don't test their software for thier flagship computer that they charge so much for. Inexcusable.

>
> Ask before you buy. And if they don't know, don't buy it. My dealings
> with Toad have been very positive, and I just don't accept your claim
> they are trying to unload non-working software on Atari users.

Where did you get the idea that I said their trying to unload non-working software? It's not the software's fault....it would work fine. It's the hardware's (Falcon) fault if it's can't run software. All I said (once again, for the 10th time) is that they should test it. If they don't know, they should find out and let you know. The first thing they should have done was test as much as they could. I suspect they just wanted to raise as few eyebrows as possible about the GAME INCOMPATIBILITIES of the Falcon. Either that, or they are lazy and don't care. Take your pick.

>
> Unless you have proof of your allegation, you owe Toad a public apology.

You have got to be joking. Only if you apologize for the misleading stuff you posted about the $999 PC...apologize to the public. You compare the Falcon in 4MB/350MB form.....didn't even up the memory to 8MB nor the hard drive to 540MB. Then try to pretend the systems are equivalent, not considring those items nor CPU, graphics, and hard disk performance. Actually, until I open the Toad catalog and see all titles tested and thumbs-up or down for Falcon compatibility on all software, my criticism stands. Why should there be shadows of doubt? I feel strongly this way because I almost bought a Falcon and this was important to me at the time.

>
> It was always an eye-opener for the owner of an original IBM PC or XT
> to discover that the Apple][and Atari 800 ran benchmarks faster than
> their machine. It was a question of efficiency, something the IBM was
> sorely lacking.

Actually, although the PC had no graphics and sound and was hence unattractive to me then, it was faster. Even the 8088 was 8/16-bit and ran at 4.77Mhz compared to the 8-bit 6502s in the Apple II and Atari 800 that ran at 1.0 and 1.79Mhz, respectively. However, the Apple's floppy disks were tremendously faster than the Atari's serial drives and the Atari's lack of an 80-column display probably contributed more to its demise as a then-small-business machine than anything else. Too bad; it was a great computer.

>
> And the best games are on the next-generation consoles, such as the

> 3D0, the Saturn, the Playstation, and the Jaguar. The clones are
> being left behind by less expensive machines again.

If you play a Super-VGA game that runs in higher than 320x200x256 colors, you'll see that state-of-the-art PC gaming wins out. Even a 640x480x256 screen looks true-to-life or like watching cartoons. The Playstation/etc will only squeeze so much out of a TV resolution. However, I have to admit that the new consoles do a hell of a job and look excellent, considering the low price. The "bleeding" of the TV screen "smoothes out the jaggies" that show up on a 320x200x256 PC screen. Keep in mind that as you say "the clones are being left behind by less expensive machines again" that you are comparing apples to oranges....a Playstation is not a personal computer - it is a video game. I guess the Playstation leaves your Falcon in the dust equally, then, eh?

>

> No, I don't like the thought of using a PClone in the place of a Falcon.

I corrected that posting to show that in effect, a full-blown Falcon cost almost twice the $999 486DX4/100 system and will never offer the CPU, Graphics, and Disk performance of that system. You need to stop thinking of clones as one brand. I could have told you 5 years ago that Packard Bell sucks. That has nothing to do with all the other brands; each has its own reliability factor as different as a Falcon does from an Amiga or Macintosh.

The above system is PENTIUM clone for $1839 and not the $999 DX4/100 I
was talking about. Note that this one is 3x again faster and has 16MB of
ram (vs. your 4) and 850MB hard drive.... THis one might cost as much as
your 4MB/350MB Falcon.

> ads in the video game magazines.

No shit. They don't even buy Barbee dolls and Tonka trucks. They see
the advertisement and nag the hell out of their parents. That's how it
works. Don't try to qualify Atari's bargain advertisement. They're too
cheap to pay for prime-time, so they miss the boat and advertise to
late-nite TV watchers instead of the kids. Once again, I wonder why you
can't see this.

>
> What's bad is that the Pentium *needs* 100 MHz and 16 Megs to outdo the
> Falcon with it's 16 MHz '030.

No, it needs 100Mhz to true-color photomorph. It would only need about
4Mhz to outpace a 16Mhz 030.

>
> People who write benchmark programs write them to exploit the total

> What we do know is: at a real-world trade show, the Falcon ran the
> benchmark faster than the Apple Mac Quadra, a '486 @ 66 MHz, and the
> (then) new DEC Alpha system.

People who write benchmark programs write them to the best of their
abilities, I would say. We can't know whether or not they exploited the
machine's potential completely. What we do know is that Atari somehow
managed (surprise!!) to achieve the impossible on their computer, beating
out a DEC Alpha with a lowly 16Mhz 68030, which common sense mandates, is
an anomoly. This benchmark is useless without great details of the
benchmark and the hardware upon which it was run, and is an anmoly and
Atari advertising. Period.

>
> Your $999.00 computer costs $100.00 more than a Falcon when equipped
> with standard Falcon hardware.

Correction....your Falcon costs almost TWICE what the $999 computer
costs, and will never boast of such CPU, Graphics, and disk performance
of the $999 computer. You based your claim on such lies as charging $180

for the operating system on the $999 computer (which is indeed included) and for stuff like Jaguar joystick ports (as if any PC user would want them), and then had the audacity to compare this to a 4MB/350meg Falcon...as if that's equivalent to a full-blown DX4/100Mhz system.

The purpose of the Atari benchmark was simply an Atari advertisement.
When Digital Equipment runs the benchmark on the Atari, then I'll
believe the results. Digital Equipment is a more reputable and
believeable firm that Atari.

We've been all through that. I showed you that the Falcon cost almost
TWICE as much as the $999 486.

You know, we should get a conference call going between you and I and call Toad directly and get the scoop. The loser pays for the call. You on?

>

Great idea. You know that these machines are in the price range of current
Pentiums, don't you? Of course, they are much better than a Falcon, but
Petey-boy is so proud of his el cheapo Mac because he doesn't realise he's
bought a dead-end machine.

BTW, the 7500 would be among the machines of my choice, but I guess I'd
go for a P100 instead. There's Linux for them, and Nextstep, and I don't
see much besides MacOS for the Mac :-(.

>the Mac operating system.

Hint for the clueless: The Mac LC II was likely running its desktop at 640x480 with 256 colors. Amount of memory required for that resolution is 307200 bytes, or 300 KB exactly. All of the original ST resolutions (320x200x16, 640x200x4, 640x400 mono) require 32000 bytes = 31.25 KB. Now, could it be possible that updating nearly 10 times the screen memory as the ST had to caused the LC II to appear slow in screen updates? Naaahh, must be that it's actually a slower computer. NOT!

Responses should be posted to the newsgroup and sent via email - I'm not subscribed to the group and won't see them.

The 630 line has one PDS slot, it's true. However, it also has a few
dedicated-purpose slots: a modem/Ethernet adapter slot, a video digitizer
/ TV tuner slot, and perhaps one other I can't remember. Apple also makes
a PowerPC upgrade card for it that plugs into the 68040 socket (doesn't
take up the PDS).

>On the Falcon you can add accelerator cards on the expansion slot and than add
>additional cards on top.

IF you stick it in a different case. Why Atari used the dumbest computer
case design in the world with the Falcon instead of a new design, I don't
know. Also, the Falcon's "PDS" is not really direct, since it's a 16-bit
68000 compatible bus, rather than a true 32-bit bus direct to the 68030.

(same caveats apply as last message: if you want me to see a reply, email
it too!)

>
>Nope. Not ridiculous.

Ridiculous. For those not informed, the "benchmark" in question was a Mandelbrot set generator. DEC had written some Mandelbrot code in C and ran it on different machines at the show to demonstrate how great the Alpha was. Atari saw this at the show, and got the idea: "Hey, let's have an engineer whip up some DSP code right now and beat the Alpha." So, of course, they did. What's usually ignored by the fanatic is that algorithmic differences make this comparison absolutely *useless*. It would be a good comparison if and only if all machines were running code generated from the same source... and they weren't. For all we know, Atari could have just set the iterations per pixel down to some very low level compared to the DEC "benchmark", and used a clever algorithm instead of the brute-force (which DEC probably used since they were out to demonstrate pure raw FP speed, not algorithmic cleverness).

>: Like there's no caches.
>
>256-byte data cache. 256-byte instruction cache. (Source: Atari
>Falcon flyer dated 1992). Wrong!

Methinks the man meant L2 caches of reasonably large size, not the 68030 internal caches (which are very small - as you note, 256 bytes). Of course, a 16 MHz system barely needs caches anyway.

>: Like the fact that EVERY PC comes with SIMM slots...they're not unique.
>
>Falcon RAM can be increased from 1 Megabyte to 4 Megabytes or to
>14 Megabytes. Wrong!

SIMM slots. Not a stupid proprietary memory module. Because Atari did that, every poor sucker who buys a Falcon must spend extra on memory upgrades, and is forced to toss all existing memory when going to a larger amount.

>: Like the PCI bus that you don't have.
>
>A proprietary bus from a non-compatible platform? The Falcon has
>a SCSI-II port to use as a bus. Wrong!

PCI is the opposite of proprietary. Though it was invented by Intel, Intel does not charge royalties for its use. Intel only makes money off it if you use one of their PCI support chipsets, and they are not the sole source of such chipsets. Anybody who wants to can get copies of the PCI specification to design their own peripherals or systems.

PCI is now used in the lastest Power Macs from Apple, and will be the industry standard bus for desktop personal computers for several years to come.

Now comes the list of things you're supposed to add to a PC to make it comparable to a Falcon:

>You forgot the Localtalk(tm) Network port. Add $100.00

Don't call it a LocalTalk port unless the operating system has the AppleTalk protocol included. Until then, it's emphatically *not* a LocalTalk port. It's just a serial port, which practically any PC has at least two of.

>You forgot the Digital Signal Processor & Port. Add $250.00

Subtract those right back off. Who needs 'em? A 100 MHz PC easily has the processing power to match both the 68030 and 56002. Besides which, you can't readily get a standalone DSP on the PC - usually it's integrated into a sound card, and is not useable as a coprocessor - it's just a black box that does various kinds of sound processing for the system. And the kinds of things you use the DSP port for are pretty esoteric - Joe Blow doesn't need it.

>You forgot the SCSI II port. Add $100.00

Take that off, too. Why add a SCSI-II port when the EIDE card and drive are what you've got? What good does it do to add a capability you won't use in a basic system?

>You forgot the composite video output. Add $ 50.00

Take that off. Who needs it? Computer monitors are better, unless you're stuck with an antiquated computer like the Falcon that insists on sandbagging its hardware by making it support NTSC video out.

>You forgot the MIDI ports. Add $100.00

Take those off. MIDI support, if needed, is in the soundcard.

>You forgot the stereo microphone input. Add $ 50.00

Soundcard again.

>You forgot the Jaguar-compatible joystick ports. Add $ 50.00
> (that's in addition to the standard joystick ports)

What a jackass! You might as well add another $50 so that the PC user can plug in (unsupported) ST compatible joysticks! DUH! The PC uses different kinds of joysticks than the Falcon, and you can't add Falcon/Jag joystick capability to one. Take this item off, too.

>You forgot the operating system Add $179.95
> (Windows 95 Initial Installation) -----------

Jackass. Virtually all PCs sold come bundled with Windows 95. It's not an extra-cost item.

Gosh, looks like your entire list is gone.

>Not only does the Falcon cost less to buy, it costs less to
>maintain, as shown previously.

It costs less to maintain because the market's completely stagnant. No new products equals no new stuff to buy. If you have a PC or a Mac, you're perfectly free to use an old computer as long as it still serves your needs. The major difference is that PC and Mac software vendors tend to not design major concessions to slow machines into their new software, whereas Atari software guys have to design for slow machines, since that's all there is.

(once again, e-mail any replies to me if you want me to see them)

This is a bogosity - the Spectrum 512 display stuff is limited to static
pictures, and involves some serious processing of the images it has to
display. Very unsuited to a Net browser, which needs a simple chunky
pixel bitmap display with a decent resolution. (Spectrum 512 uses 320x200
pixels, which is totally unusable for WWW.)

> of how compatible it is with old software. 80% sounds reasonable to
> me. Games run over half of the time. All the games you sold me
> worked just fine, thanks :-).

Perhaps I was misinformed about the incompatibilities, then. I stand corrected. By the way - I still have a couple games left. One is "Sentry" by Firebird, I think the others are a couple of Infocom games like Wishbringer and another. I think the old "Time Bandits" is there too. If you (or someone) wants them, I'll send them free if you send me your address in Email and promise to send me back the few$$ for the mailing.

The only reason I felt so strongly about the Falcon's alleged incompatibilites is because when I was planning on upgrading from my ST, I hear quite a lot about it from other ST owners.

> very impressive. However, I have seen other's impressive PCs choke
> on installing 3 year old games due to lack of memory (this system had
> 16 megs).

I don't know of any games that require 16-megs. The new Mortal Kombat III game on the PC says that 16 megs is recommended, but not required. I agree that this is a ridiculous requirement. However, it is a kick-ass game. There are an increasing number of PCs with 16 megs, so in a couple of years, it may be commonplace. I have difficulty understanding why they need to do this. However, if you do have the memory then the games are *really* great, which is the bottom line for me.

The bottom line is that if someone has 16 megs and is choking out of memory on 3-year old games (let alone modern games) then they don't know what they are doing and have something configured wrong. That's the bottom line as far as the particular problem you talked about goes. I am not significantly experienced with all the PC configuration woes, but in a short time with a good book, I figured it out very well, and I don't claim to be a genius.

> Sure, I could learn to use a PC more effeceintly but why
> should I have to when I enjoy my Falcon and find it much easier-to-
> use?

Here's where everyone goes wrong against my contentions. I DO NOT think people should trash their Ataris. I think they should continue to use them if they serve well. That is one thing. It is an *ENTIRELY DIFFERENT MATTER* when they cook up lies that the same Atari is equivalent in performance to the latest Pentium. No matter how easy it is to use, it simply is not a Pentium 133Mhz or even a high-end 486.

Period. My intent was simply to retort the LIES and BS CLAIMS that the Falcon performs with new, state-of-the-art hardware. How could it? It's years old; it shouldn't be expected to. However, there are some users out there who think their 16Mhz 68030 will outperform a Alpha 200Mhz and cite some silly unknown benchmark as evidence. I'm just looking for a little truth.

> I believe that a little while back you were saying how great
> the ST was and how difficult it was to use an IBM. Why the change
> of heart, if you don't mind me asking?

Not at all; I don't mind you asking. However, this is not a matter of "heart." In my evaluation of hardware, I attempt to refrain (as much as possible) from emotion and stick to the facts. I also prefer a broader perspective that although one computer may be easier to use, that cannot be the sole criteria for judgement.

I still say that the ST is easier to use. Back in the arguement that you are referencing, Bob Retelle was trying to tell me that juggling PC CONFIG files and segmented memory was no more difficult than using an ST. That was simply not true. Just because I am now using a PC doesn't mean that I have changed my opinion on the matter. That would be a lie. However, neither does it invalidate the claims I have made about the PC. I've learned to deal with the "pitfalls" of the PC and I can reap many benefits from it once I learn to deal with the caveats.

> Anyway, you could argue that I am biased and brand loyal to Ataris.

To each his own. I used to be that way, but I have found that it didn't benefit me to be that way. Now, I just go with what gives me the most performance and runs the software I want at the best price. Presently, it is PC. In the future, it wouldn't surprise me if it is some Power PC or equivalent. I'll make no claims to loyalty when I shitbox my PC in favor of the next hot setup. Until then, I'll get much utility out of this setup for the price.

> I see all the
> trials that PC users go through and don't want to jump through
> the same hoops to get programs to run.

I did think that way, then I noticed how many complete dumbasses use PCs successfully and noting that they aren't rocket scientists and I'm fairly intelligent, reasoned that it wouldn't be much of a challenge to me if I got a good book. It hasn't.

>I also, out of principle,
> do not want to run anything from Microsoft on my home computer.

I don't understand this attitude. The Microsoft applications that I use net me the most utility of any programs I've ever run. I have no LIKE of Microsoft, nor do I have an aversion of them because I have no reason to. When Microsoft fails to serve me well, chances are that they will fail to serve others well and competing software will rise out of

necessity. Once again, I just take the least path of resistance and use whatever works the best for the least money. While I don't like to see any one player dominate the industry so well, the fact (to me, anyway) is that since Microsoft applications work well for me, I'd be selling myself short to try and "boycott" them. My one-man boycott would be too insignificant to affect changes, and I would be served less by avoiding them. This further reinforces my belief in disregarding brands (whether it's a preference for Atari or an aversion to Microsoft) and just go with what works for me. At present, Microsoft apps are a pretty good value. When they fail to be, you won't find me posting that I love them and have a loyalty to them, nor will I hail the successor. I'll just silently use whatever "wins out."

> I am not going to try to argue that the Atari can compete with an
> IBM in raw computing power at the same price. I would argue, though,
> that TOS 4.04 completely kills anything that runs on the PC. In
> that respect, the Atari wins. This is something that will not show
> up in benchmarks.

This is a matter of opinion. If someone wants to overanalyze Windows code and harp on 16-bit portions, I'm sure there is a basis for doing so. However, in a real-world sense, it works great for me. The most multitasking I want to do is to download high-speed in the background and I've been able to do that for some time on the PC. It's also easy to cut and paste between applications (even DOS applications) so what else do I need to do? Why is anything that runs on the PC "killed?" I'm not lying; I do these things satisfactorily. Why do I need to overanalyze?

> I am also from the old days of computing when people used their
> systems for fun and leisure. The Falcon is not merely a tool for
> me; it is a form of entertainment.

As is my computer. It doesn't get much better than Wing Commander III.

> Will C-Lab
> take the market by storm with Falcon clones? Most likely not.

They would if the system was a bargain value with tons of software. However, I seriously doubt that will be the case, and I am forced to agree with your prediction.

> They will, however, ensure a supply of good, fun computing systems
> for hobbyists like myself. It also gives people choice.

True. Just as Gateway 2000 ensures a supply of good, fun computing systems for many people.

> Glad you enjoy your PC. Oh, and could you stop laughing in your
> posts? I find that unneccessary and annoying.

Glad you enjoy your Falcon.

For your information, the purpose of "laughter" in my posts is to illustrate how laughable the *RIDICULOUS* claims are that were made in

the course of the arguement. They were not intended to appease you, so I suggest that you ignore them. An example was when I "laughed" at some guy's claim that a Falcon's 16Mhz 68030 can smoke a 66Mhz 486DX2. As a biased Atari Falcon owner, of course you find such laughter "unnecessary and annoying" but I wish to take issue with you on that account. I find it quite humorous and definitely deserving of laughter. I'd be equally amused if you told me that your Yugo could smoke my 5.0 Mustang.

James

He he he he he he. Yes it has one PDS slot but has other specific slots and is
lots more expnadable.

>
> On the Falcon you can add accelerator cards on the expansion slot and than add
> additional cards on top.

I can do the same as well such as DayStars PPC board. But I may opt for Apples
cheap PPC logic board. Considering that I have a fast 040, your Falcon has to
play catch up thus increasing the price.

>
> On the LC630 you can't connect a new IDE harddisk, because it has to be

> the Jag CDROM here. No no no, I deem Sinclap to be a reasonable man, so
> let's take a circutous route to his reasoning processes. A wondrous journey
> indeed!

Fact: Atari's recent 3Q sales collapsed from the same Q a year ago.
Fact: Atari's cash reserves have declined to $52 million from a high of $75
million.
Fact: Atari lost $13 million in Q3. Do you thing Atari will ever recoup all
those millions that has been spent?
Fact: Analysts have stated that Atari may call it quits soon!

>
> First of all, he addresses Atari as a single entity, and in a very personal
> manner, hence, his use of "You". Sinclap then uses a form of the word "blow",
> which in some contexts means to feed fire to a flame. Since Sinclap is

: I had previously made some comments about this benchmark and asked some
: questions about it. Before we take this benchmark seriously, can someone
: address them?

I do not have the technical details available. Benchmarks are usually written to use the hardware to it's greatest advantage. James Woods correctly pointed out that Digital Equipment Corporation *may* have fudged the Mac and '486 benchmarks, although he offered no proof.

That's the story to date.

: >The fact that I *can* put a coprocessor in a designated socket means
: >it's NOT expandable? Wrong!

: What he was saying is that it should already have a coprocessor, making
: the socket unnecessary.

I asked "exactly nonexpandable how"? He said it didn't have a math coprocessor. Then I asked "the fact that I *can* put a coprocessor in a designated socket means it's NOT expandable? Wrong!" The installation of the math coprocessor is an expansion.

: >A proprietary bus from a non-compatible platform? The Falcon has
: >a SCSI-II port to use as a bus. Wrong!

: PCI is not a propriety bus! And PC PCI cards work fine in the Mac so long
: as the manufacurer writes a Mac driver. And SCSI-II is way too slow for
: some types of expansion.

If SCSI-II is too slow, then it's best to use the Falcon's internal processor direct slot, which also qualifies as an expansion bus.

Ok kiddies, let's all get out our Crayons. Little Brian, you color
us a picture. Because you have broken some of your Crayons, you can
only use 256 of them to color the pretty forrest. If that is not
enough, you can smear some of them together and try to make the colors
look as close as possible to what you see. But you can't end up with
over 4096 shades, and be sure to mix them carefully, or you'll see dots.
Mikey, you draw us a picture.
You have to draw the same forrest as Brian, but you can use all
64,000 of your Crayons to color your picture. You probably won't
have to smear as much as Little Brian to make it pretty.
None of the "AV for the Masses" cards provide CinPac or Motion
JPEG compression of any quality for printing purposes. In the quality
range that you or I could afford, the best we can get at 16 or 24
bit color,340*240 size is 7 to 10fps, which prints just fine on my
Falcon. If I remember correctly, the AV's, in stock form, can only
capture 8bit video. This is fine for viewing on your CRT, but looks
like shit on tape. Even if I have to go to 240*200 at 15fps, the
Falcon video animation looks much better at 16bit overlayed onto
my source tape than what the standard 040 or PPC outputs. I say
standard as I live in the real world. I have a house payment and
a 12 year old to support as well as my computer habbits. Even at
48k a year, I would be hard pressed to purchase a 275mhz Alpha and
Video Toaster Flyer to do broadcast quality work, but I'll bet I could
fool my local cable company with a Ma and Pa Market spot. By the way,
what do they pay at SFU? (Love those 49'ers, ehh? Who the hell

was Carolina?:).
This is my last spot. I just can't justify spending the time
expressing my views of

"Why in the living hell do people still use Ataris"

especially in an Atari newsgroup.

We use them because we like them.
No go home.

>about the fact that it's an Atari for a moment - sorry, there's no magic
>that will allow it to achieve more than a 16Mhz 68030 will do.

You should perhaps check for the other components of the Falcon. The
Falcon _was_ running a Mandelbrot brute force algorithm in 16 bit colour
depth faster than the other machines.

>All I can tell you is that if you **really** believe that a 16Mhz 68030

WRONG, don't know what you are laughing about. The Falcon 030 at 16 MHZ
cannot raytrace as fast as an IBM, but kick in the DSP and it leaves the
486/100 or pentium 90 WAY behind.

: LYNX blows away the PlayStation!

It is true that the Desktop isn't the best comparison, but it is known
that an Atari 520 ST can keep up with the speed of a 486 SX 25 and the ST
was brought out at least 6 years before the 486 anything.

Actually you can get quite a number of graphic-cards for the Amiga, but mostly
for A3000 and A4000 machines.

> outdated chipset, slow bus system,
> does. And Escom have only _announced_ new machines yet.

I agree. I mean even the Falcon has lot faster graphics than the A1200 and A4000.
And the AGA chipset hasn't got any 'real' 16-bit High-Color mode (65536 Colors).
Only 8-bit coded Hold-And-Modify (HAM8-mode).
And only 8-bit 4 channel sound compared to the Falcon 16-bit 50Khz 8 channel sound
(32 channels using the DSP).

Keep Cool and Flying...

Sorry to interrupt. The benchmark that he referres to is was done on the DSP56001
in the Falcon which is many times (10-15 times) faster than the 68030.

But I agree with you in the other terms (of course). :-)

> No, not "Wrong!" I didn't say that the Falcon couldn't be expanded.

> that in anticipation of an explanation.
>
When using the 'standard' upgrade you can get 14 Mb RAM ST-RAM (with a 16MB SIMM).

But if you use a BlowFX Card or a MAGNUM card, you can achieve more flexible
RAM config's like - say 8 MB or more. And the good thing about those cards are that
the additional RAM (besides the standard 4 MB ST-RAM) is addressed as FastRAM.
With a 200% faster fetch-time, gives better CPU performance, especially at 32, 36 or
40 Mhz.

> So
> basically you're up to speed now with a 386/33 from 1989?

That's not really true. The 68030 is a lot more effective than the 80386.
And don't forget the DSP56001, remember it's not a 'dumb' DSP like those on the
cheap PC-sound cards, it's a full-blown processor which can be used in many different
areas like 3D grafix, sound (of course), filter design, number crunching etc.etc.

> > You forgot the Digital Signal Processor & Port. Add $250.00
>
> Well, deduct the $100 for the 16-bit sound card and add Sound Blaster
> ASP for about another $50

First the Sound Blaster 16 is not quite in prof.quality, actually the Falcon is.
And the DSP on the Sound Blaster is nowhere as powerfull as a DSP56001.
>
> What for? (Wrong!). I use EIDE CD-ROMS and hard disks.
> Add nothing. Wrong!

SCCI-II accepts multiple devices and can control 8 devices, that's a good thing and
it's also a lot more intelligent (SCSI devices have a lot of commands, so that the computer
itself doesn't need to spend so much time on read/write/format etc.). And by the way you
NEED a SCSI interface connect a CD-ROM writer.

> > You forgot the composite video output. Add $ 50.00
>

That's right. But what if you wan't to do video-titling, presentations ?

> Add $25 for a little "dongle" that converts the joystick
> port into MIDI ports. Wrong!

Yes. Now you only need the correct driver and hope that your favorite music-programs
support the particular MIDI-port driver.

> > You forgot the stereo microphone input. Add $ 50.00
>
> Even the cheapest PC sound cards have these, and the

Yeah. I agree here. So what ?

> Wrong!!!! That $999 includes Win 95. Wrong!!
> add nothing.

If just Windows95 was a decent OS. I prefer LiNUX which is free and avaiable for
PC's, Atari's and Amiga's.

> Why the hell would anyone want to delete the CD-ROM? Just add one to the
> Falcon. Then good luck finding discs.

There are actually quite a lot CD-ROM's for the Falcon. Even games.
But yes, not as many as on the PC - of course not.

> 1) run at 100Mhz

The clock-speed doesn't say everything - but it helps :-)
A 33 Mhz 68040 runs faster than a 33 Mhz 80486 for instance.
The amount of clock-cycles the 68040 takes for completing certain instructions are less (ie. faster) than the 80486.

> 2) L1 and L2 caches

Actually the Falcon has L1 cache (inside the 68030). FastRAM does the trick in terms of L2 cache.

> 3) on-chip match co-processor

Yes. Agreed.

> 4) open VLB or PCI slots

Yes. Only that VLB is trash. PCI is better (and safer).

> 5) Run 1024x768 non-interlaced hi-color

Yes.

> What amount of money would let your Falcon do that, when it's already
> almost twice the price?

Try and go out and examine what you need for a PC, if you wanted to do harddisk-recording. Now that makes the PC EXPENSIVE indeed compared to the Falcon MK.

> > Not only does the Falcon cost less to buy, it costs less to
> > maintain, as shown previously.
>
> You stand corrected.

Maybe, in some terms. But certainly not when it comes to harddisk recording!

> What do you mean similar equipment and power? I'm talking about
> graphics, CPU, and hard disk performance that no Falcon can even
> approach, at about half the price. There **IS* no "similar equipment and
> power" at any price on the Falcon.

Harddisk-recording. Video-titling. Presentation effects on broadcast monitors.
That's expensive on the PC.

> You're maxed out at 32Mhz and even
> that kludge doesn't help how your 16Mhz motherboard talks to RAM.

Unless the Falcon has FastRAM installed.

> I know what you mean. I am using a Compaq LTE286 portable at this

> up with some Mac prices.

The Medusa T40 costs approx. 1900 Dollars here in Europe with 8 MB RAM and a TrueColor graphic card and a 800 Mb Harddisk.
Don't know the price for the Medusa T60 or the Eagle and DirecTT.

Keep Cool and Flying...

> depth faster than the other machines.

As someone else mentioned here, it probably had a more clever algorithm. The purpose of the benchmark was to put the processor to work and measure the brute force of its ability. It is possible to rewrite a benchmark with a different algorithm that works better and make it appear that the computer is what is faster. When Falcons start beating DEC ALPHAS than it's time to raise such eyebrows.

>
> >All I can tell you is that if you **really** believe that a 16Mhz 68030
> >will outperform those other processors

The DEC ALPHA is an issue, and when a little Falcon starts beating out a Alpha, and of course it's Atari who did the benchmark, then it sounds like a crock. The mC68030 is certainly a part of the issue, dummy.

>
> It was neither disk nor processor based. And yes, the comparison _is_

It wasn't disk or processor based? You mean it didn't run on one of the Falcon's processors? What the hell are you talking about - do not benchmarks run on processors? What else is the code going to run on?

>
> >Have you ever heard of "not

3067. Re: (very long) Cost of Ownership

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-07 00:00:00 UTC
From: dferran@crash.cts.com
Message-ID: <47n1p8$lpu@news2.cts.com>
Source record: 11072

Realizing that he has lost the system comparison discussion, the
thoughtful James Wood (jamesw@PEAK.ORG) attempts to change the
subject with:

: At this point, let's just consider the Falcon a 16Mhz 68030. Forget
: about the fact that it's an Atari for a moment - sorry, there's no magic
: that will allow it to achieve more than a 16Mhz 68030 will do.

Here's where we can clarify the system comparison! Not only does
the Falcon have a 16 MHz 68030 microprocessor, but it's also got:
a standard 32 MHz 56001 Digital Signal Processor,
a standard Blitter graphics accelerator chip (believed to
operate at 16 MHz), and
an optional 16 MHz 68882 math coprocessor.

These four chips operating in concert make it reasonable to believe
the benchmark results are accurate, especially when you consider that
the other three systems are likely to omit the DSP and Blitter.

When you suggested a price comparison of a '486 with equivalent
hardware to the Falcon, I attempted to add these to the '486 to
make things equal (accidentally forgetting the Blitter, which
would add another $200.00 to the '486 system cost according to
CompUSA), but you refused.

Now I understand that you're comparing theoretical central processor
performance and not real-world system performance. No wonder we
can't agree!

: You'd better be prepared to explain how something like that can
: occur, or shut up.

There's your explanation -- I've been discussing system performance,
you've been discussing theoretical microprocessor performance.

: > 256-byte data cache. 256-byte instruction cache. (Source: Atari
: > Falcon flyer dated 1992). Wrong!

: So there's 512K of cache? Are you claiming this to be L1 or L2? Where
: is this cache, and in what form of chips? How many nanoseconds are the
: cache chips rated at?

As far as I can tell, the 256-byte data cache and 256-byte instruction
cache are built-in to the 68030.

: > Falcon RAM can be increased from 1 Megabyte to 4 Megabytes or to
: > 14 Megabytes. Wrong!

: No, not "Wrong!" I didn't say that the Falcon couldn't be expanded.
: I was simply stating that when you boast of the Falcon's SIMM slots,
: understand that other computers used SIMMS years before Atari, so I just
: meant to say that it's not a big deal and certainly no credit to the
: Atari. I NEVER SAID THE FALCON DIDN'T USE SIMMS, BOZO. Go back and
: re-read my comments on the matter before you spout "Wrong!" so much.

In responding to the claim that the Falcon was "non expandable", I
replied "Like the system RAM that can be expanded from 1 Meg to 4 Meg
or 14 Meg." [among the other available expansions that were listed].

You then noted "Like the fact that EVERY PC comes with SIMM slots...
they're not unique."

Since we were discussing expandability, I understood your comment to
be that the RAM was not expandable and replied "Falcon RAM can be
increased from 1 Megabyte to 4 Megabytes or to 14 Megabytes. Wrong!"
In attempting to stick to the subject at hand, I made no mention of
SIMMs in any of my answers, but referred to the expandability of RAM.

So my "Wrong!" reflects my answer to your apparent claim that Falcon
RAM is not expandable.

: Incidentally, 1, 4, and 14 megabytes are some lame choices.

It *would* be nice to have an 8 megabyte option. I agree.

: Seems like I recall the Falcon only using 12 of the 14 megabytes...
: but I never fully understood the criticism.

Here's the techie answer:
The installed RAM chips have a 16 megabyte capacity. RAM locations
below 0x000005B4 are reserved for system variables, while locations
just above this point are used for various OS features (most likely
stacks and GEM stuff). Locations above 0x00DFFFFF are reserved for
the operating system ROMs (ever since TOS 1.06).

The non-technie answer:
The missing two-megabytes are used to provide GEM/TOS features in
much the same way the MS-DOS/Windows requires several megabytes
of RAM for proper operation.

: > : Like the fact that you can't just drop a 66Mhz or 100Mhz
: > : (or 120Mhz) clock multiplied chip in the same hole as your
: > : present one....
: >
: > The 32 MHz upgrade isn't just a drop-in-the-hole replacement, true.
: > But the clock speed can be increased. Wrong!

: Put that "Wrong!" where the sun don't shine. You say "True" that it's
: not a drop-in-the-hole upgrade, then call me "Wrong!" That is a
: dichotomy. Perhaps it illustrates your ongoing predilection in this
: thread to eagerly accuse others of being "Wrong!" without understanding
: their statements, much less know what you are talking about.

Since we were on the topic of "Exactly nonexpandable how?", I
understood your comment to be "You can't increase the clock speed
of the Falcon." You can do so, but not by the method you
described. In answer to your claim that the clock speed on the
Falcon cannot be increased, I conceded that it could not be done
the way you describe, but noted that it could be done.

: So basically you're up to speed now with a 386/33 from 1989?

No, the 520 ST from 1985 is generally considered to have processing
power equivalent to a '386 running at 33 MHz. Good guess, however.

: > : Yeah right. All over Computer Shopper (on cover too) are $999
: > : (and less) systems. Please take the time to attempt to
: > : construct a Falcon system to these specs, and list the
: > : prices from the Toad catalog. Naturally, you can't match
: > : it, but come as close as possible, starting with a brand new
: > : Falcon. Then add hard drive, RAM, CD-ROM, co-processor, etc.
: > : Please list the prices and prove your point:
: >
: > You forgot the Localtalk(tm) Network port. Add $100.00

: A cheap network card is more like $50. However, Atari would have done
: well to omit it from the Falcon since most people don't use it and the
: Falcon is so voraciously overpriced with such unused junk.
: oh yeah....."Wrong!"

If the systems are to be comparable, then the '486 must have the
Localtalk(tm) Network port.

: > You forgot the Digital Signal Processor & Port. Add $250.00

: Well, deduct the $100 for the 16-bit sound card and add Sound Blaster
: ASP for about another $50

Don't forget that you must have a connector ("port") for the
general-purpose DSP. The sound card isn't "general-purpose"
like the DSP is. Nice try.

: > You forgot the SCSI II port. Add $100.00

: What for? (Wrong!). I use EIDE CD-ROMS and hard disks.
: Add nothing. Wrong!

If you want the '486 to have the same equipment as the Falcon
for a fair comparison, it must be included. Nice try.

: > You forgot the composite video output. Add $ 50.00

: Compisite video sucks and can't display 1024x768.
: Add nothing. SVGA video output is superior.

If you want the '486 to have the same equipment as the Falcon
for a fair comparison, it must be included. Again, nice try.

: > You forgot the MIDI ports. Add $100.00

: Add $25 for a little "dongle" that converts the joystick
: port into MIDI ports. Wrong!

MIDI is for music and is generally associated with sound cards.
Every sound card I've ever seen on a PClone does not have the
MIDI ports.

: > You forgot the stereo microphone input. Add $ 50.00

: Even the cheapest PC sound cards have these, and the
: stereo ones have stereo inputs. Shows what you
: know. Wrong!!! add nothing.

One of the big drawbacks to PClone purchasing is that
you only get what is specified. You did not specify
the stereo microphone input in your system description,
and given your efforts to cobble together a bargain-
basement system, there is good reason to believe you
left them out.

: > You forgot the Jaguar-compatible joystick ports. Add $ 50.00
: > (that's in addition to the standard joystick ports)

: What the hell would anyone want this for? PCs use the best
: analog joyticks you could want, like the Flightstick Pro.

First of all, to be compatible with the Falcon for a fair
comparison. Second of all, the Jaguar plug-in card for
PClones is under development and will probably require
them.

: > You forgot the operating system Add $179.95
: > (Windows 95 Initial Installation) -----------

: Wrong!!!! That $999 includes Win 95. Wrong!!
: add nothing.

Unlike the Atari, which has a standard built-in operating
system, PClones require you to specify the OS (MS-DOS,
DR-DOS, MS-Windows, OS-2, Linux, etc.) and install it on
your hard drive. Since it wasn't specified, there is no
way to tell if it's included.

Since this is a new system receiving an operating system
for the first time, the $179.00 for the Microsoft Windows
Initial Installation is correct (source: CompUSA).

: > Total Add-On Cost For Falcon Goodies To '486 Add $879.95
Plus Blitter Graphics Accelerator (forgot!) $200.00
Plus Mouse (how did I miss that?) $ 50.00
: > Plus Cost of '486 $999.99
: > -----------
New Sub Total $2,129.94
: > Less Quad-Speed CD-ROM Drive (Reveal CDQ100) $ 179.99
: > -----------

: Why the hell would anyone want to delete the CD-ROM? Just add one
: to the Falcon. Then good luck finding discs.

Since I'm adjusting the '486 to reflect the standard Falcon
configuration, and since the Falcon does not come with a
CD-ROM drive standard, it seemed reasonable to remove it from
the '486.

New Grand Total, '486 With Falcon Goodies $1,949.95

: > C-Lab Falcon Mark II, 4 Meg of RAM,
: > 350 Meg Internal Hard Drive $1,349.00
68882 Math Coprocessor (forgot!) $ 60.00
: > Color Monitor $ 250.00
: > -----------
New Grand Total, Falcon $1,659.00

Falcon savings with respect to comparable '486: $ 290.95

Regarding Falcon storage: generally speaking, a 10K "C" source file
will compile to approximately 5K of executable program on the Atari,
while the same source file will compile to about 20K on a PClone.

This four-to-one ratio suggests that 4 Meg of Falcon RAM translates to
16 Meg of PClone RAM, and 350 Meg of Falcon hard drive translates to a
1.24 Gig hard drive on the PClone.

This is why I can compare a Falcon with 4 Megabytes of RAM and 320
Megabytes of hard drive to a PClone with 8 Megabytes of RAM and
820 Megabytes of hard drive. Compact, efficient programs on the
Falcon do not demand as much storage as the equivalent applications
on the PClone.

: > Not only does the Falcon cost less to buy, it costs less to
: > maintain, as shown previously.

: You stand corrected.

True. I had thought the Falcon was $100.00 less expensive. Actually,
it's almost $300.00 less expensive.

: > I have already stated previously that I do not believe that I am
: > immune to depreciation, and that means I do not believe I'm immune
: > to obsolescence, either. What it *does* mean is that I believe you
: > should receive several years of service from your machine before
: > contemplating an upgrade.

: I know what you mean. I am using a Compaq LTE286 portable at this
: particular moment, and although it's years old, it sure seems to get the
: job done. Guess all PCs don't have to be new to work, eh?

The longer you can use your machine, the more cost-effective it becomes.

I thought I would take a chance at a posting in this group...

I don't care about 100MHz CPU's, 24bit graphics capability, an OS (MSWin95) that is shared among millions or any of the other crud that people in this newsgroup seem to pontificate about. I own my Falcon because it is a DAMNED NICE MACHINE TO USE!!. I use Win95 at work and am already sick to death of the confusing and never ending array of 'This is incorrect, please setup AGAIN' type messages I see.

When will PC users (and certain Mac users too...) admit that the day-to-day operating systems they use are a COMPLETE PIG to use, next to the wonderfully uncomplicated TOS 4.04. TOS 4.04 is admittedly a bit frugal, but when it comes down to it, it runs rings around other OS's for ease of use and ease of learning.

I get told to NOT quote times for 'real-world' benchmarks that use the DSP on my Falcon. I refute that, because the DSP is a STANDARD part of the Falcon. It still takes a DX4/75 or better to decrunch JPEGs/GIFs faster, and it is generally more of a pain in the butt to do so on PC.

Perhaps other Falcon owners can stop getting into hackneyed old arguments about CPU/system clock speed etc...and start looking at the things that we are 'really' concerned with, like USER-FRIENDLINESS etc...

Ciao, Chris Wilkinson. <chriswil@southern.co.nz>

>> Falcon _was_ running a Mandelbrot brute force algorithm in 16 bit colour
>> depth faster than the other machines.
>
>As someone else mentioned here, it probably had a more clever algorithm.

Even more probably it has a 32 MHz 56001 DSP.

>> The MC68030 isn't an issue. Please try again.
>
>The DEC ALPHA is an issue, and when a little Falcon starts beating out a
>Alpha, and of course it's Atari who did the benchmark,

Nope, they didn't, they didn't even write the program. It was just
coincidence that DEC decided Mandelbrot calculations were great
"benchmarks".

>> It was neither disk nor processor based. And yes, the comparison _is_
>> stupid. But that doesn't mean the figures given to you aren't true, just
>> that something essential was left out.
>
>It wasn't disk or processor based? You mean it didn't run on one of the
>Falcon's processors?

It didn't run on the CPU, usually people refer to the CPU when saying
"processor based". it was my mistake that I didn't use the correct term.

>> The data given is correct.
>
>Oh gee - thanks for your opinion. That's all that counts.

The program is supplied with the BlowUp software. As I owned a Falcon some
years ago and had this software package installed, I have seen it myself.
Pretty impressive what the DSP is capable of.

>
>And I can just buy standard SIMMS for all the Atari machines, right?

Cite me claiming that. You can buy standard SIMMs for the STE and - if
provided with the appropriate daughterboard - the Falcon and TT. I *hated*
the extra cost for the daughterboards, but it shows that it wasn't that
bad, for I can get the aixTT daughterboard for the TT and use PS/2 SIMMs
instead of old 30 pin ones.

>Up your ass, nimrod.

>"benchmarks".

I was still heavily into Ataris at the time this whole "benchmark"
happened. At the time I loved it, but I was letting my enthusiasm for the
machine overcome any suspicions I had about what it actually meant about
relative performance.

According to the account I read of the whole thing, DEC and Atari got
stuck pretty close to each other at a trade show. DEC had written a
brute-force Mandelbrot algorithm, and was using it to demonstrate the
Alpha's FP performance advantage over the 040 and 486. Atari, seeing
this, got the idea to embarass DEC. So they had an engineer write a
Mandelbrot generator that ran on the Falcon's DSP. It ran faster, Atari
supposedly got DEC mad, etc.

The difficulty is that the same source code and parameters used in DEC's
tests were not used by the Falcon. This means that the comparison of the
Falcon to the Alpha was bogus.

If Atari had used the same code and parameters, you can bet it would have
ended up being the slowest of the machines. The 56001 does 24-bit fixed
point math. In order to do 32-bit or 64-bit floating point math as used
on the other processors (I don't know which precision they used), the
56001 would have to take a horrible speed hit to emulate FP in software.

Source record: 11081

I have to agree with much of what Henrik said about the Falcon. Congrats on his ability to judge fairly and explain his reasons. His claims all seemed reasonable.

The only thing I might tend to disagree with him on is the quality of sound on the PC because the nicer cards are not only "up to snuff" but quite snazzy.

Thorsten Guenther and George Crissman should learn to post reasonable messages and perhaps they would be better received.

James

3077. Thorsen Guenther and name-calling.

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-09 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.951109100728.18523C-100000@PEAK.ORG>
Source record: 11082

Mr. Guenther (in a rather self-righteous move, I must declare) posted what I had emailed to him. Of course, the reason I emailed it was because I didn't feel obligated to subject everyone to the name-calling content. Of course, I would have refrained from name-calling if he could have been man enough, but since he opened the floodgates of name-calling, I couldn't resist. He then takes particular name-calling elements from my message to him and posts them out of context - taking the response (name-calling) away from the stimulus (his cocky, know-it-all contention). Thorsten: If you're ready to stop the name-calling then I'll follow suit. Best you consider the fact that barbs you throw will only be thrown back harder, and honest, objective, reasonable thinking and explanation of thoughts seem to make people's points clearer to their audience.

>capture 8bit video.

You remember incorrectly. Apple's 660AV and 840AV machines (their first
out of the box AV machines) digitize in 24-bit YUV, which is converted in
real time by one of the AV chips to 16-bit RGB for playthrough to the
monitor. The bit depth of capture and playthrough is independent of the
computer's bit depth, because they use a split frame buffer architecture -
1/2 of the VRAM is used for computer graphics, 1/2 for the video frame
buffer. You can run the computer's display in 4-color mode, and still get
16-bit playthrough in a window. You can capture in 8, 16, or 24-bit
color. How many FPS you can achieve is limited by the speed of your hard
drive (which is the major bottleneck in any video capture scheme). If you
want to, you can buy a realtime compression card that plugs into the AV
connector on the 660/840AV motherboard, so that it can do full 30fps
capture at 640x480 in 24-bit color. (Of course, such boards cost around
$1000, but that price is inevitable - it's still quite expensive to build
hardware that can do realtime MPEG compression at that frame rate and
picture size.)

The PowerMac 6100AV, 7100AV, and 8100AV retain essentially the same
capture setup as the 660/840AV, with minor enhancements. The new 7500 and
8500 models have an entirely new setup that has lots of improvements over
the old scheme.

The reason I switched to Mac a couple years ago was simple: a Quadra 660AV
provided much more performance than the Falcon, had much better support
built in for sound and video capture, and cost about the same overall.

(Yes, guys, I know the Falcon is soooo great for D2D audio recording. I
don't care; I don't do that.)

C= is gone...Amiga technologies, a subsidiary of Escom AG are the new owners. At last weeks Video Toaster World in LA, Escom announced the availability of the overpriced A4000. AT also announced that future Amigas will be PPC and will be called Power Amiga. AT and Apple have entered a strategic relationship. Apple showed AT, Quicktime working on the Amiga.

Did I? I have never seen the Falcon. When I was living in Connecticut in the 80's, there was a local mom/pop store carrying the Atari/C= line. I made biweekly or monthly visits to the store to see what was new for the Amiga.

In C.F. Iowa, there is no one that sells the ST and now the Amiga.

What is a slightly modified Falcon? One with an 040 board? If so, the cost
would be in stratosphere.

Why would you want a Q700 or 900? New Q950's can be had for $1499.

Most babble ignored..

For what you may have invested in your Falcon, a Toaster system could of been had.

A3000's can be had for $500-$1000 depending on configuration and used Toaster 4000's can be had for $1000.

Yes. A Meagre is the best computer.

A mate of mine took me to a computer demolition event recently, and we had immense fun demolishing computers right left and centre.

I eventually got to be fairly good at swinging an axe at various computers and the Meagre was among the best to demolish. If you hit it just right, it just dismantles itself very well.

(From what Dave Small has written in "current Notes" [or was it the Spectre manual?], it is probably something he would have enjoyed as well.)

: So were is this mythical web browser and how come it is ignored by the media?

Oh come on SinClap, don't be an ass. It's been posted several times
that you can have www108.zip on atari.archive.umich.edu. And just
just incase you're too lazy, I've appended www108.uue, a uuencoded
version of www108.zip to the end of this message.

As for "how come it is ignored by the media?". What media are you talking
about? You don't read any ST mags, and the entire Atari line has been
ignored by all mainstream media for years. But, I belive that STReport
may have recently had an article on the Atari browser. Since I don't
read that, I could be wrong.

In other words a new Falcon would cost more than a new A1200...

But the A1200 will have a future because Amiga Technologies will provide a PPC
upgrade card solution for it in 1996. Amiga OS will be ported to PPC through
partnership with Apple, IBM and Mortorola...

Plus all new PPC machines will also be available in 1996..

3093. Re: Pricing For '486/66 MHz

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-11 00:00:00 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <B7LFS6o.ari2550@delphi.com>
Source record: 10948

What are you smoking?!? The Falcon a better deal than a 486DX-66???

First of all, you need to learn how to shop for a PC.

You almost never go to a chain like CompUSA - their prices suck.
PCs are the most generic computer ever made. The only difference between
a $2000 Compaq and a $1000 Taiwanese clone is that you're paying for
Compaq's marketing and advertising. As long as you verify the components
in the clone PC to be good (i.e. the HD maker, the BIOS, the CD-ROM, etc.)
you're in good shape. PC's don't fail very often and on-site service is
almost always a waste of dough.

Pickup a copy of ComputerShopper and shop around - there's a ton of vendors
that vary in price so shop around. I know for a fact you can pick up
a DX-66 system for well under $1200 fully equipped.

Second, there's no question the Falcon has better built-in sound than the
usual SB-16 card one gets with their PC Clone. However, unless you're
a professional musician and have the expensive, specialized software to
take advantage of it - its no advantage. Almost every PC game and every
PC CD-ROM take advantage of the sound cards.

Third, unless you get ripped by the PC vendor, the PCI or VLB SVGA card
you get bundled with your system will almost always be accelerated with
a co-processor. This is in the very least eqivalent if not superior to
the Falcon's much heralded BLiTter chip (which is just a hardware version
of the TOS Line-A memory-move command). Many modern SVGA cards have
very sophisticated accelerator chips that have hardware versions of
line drawing commands as well as memory-moves. On top of this, many
of these cards can do 16bit and 24bit color. If you shop around, you
might even get a card with a hardware based MPEG decoder!

Fourth, the Falcon may or may not be easier to use but its limited in
what it can do inerms of software selection. With the 486DX-66, you
can run the 30,000 or so commercial PC programs or the countless thousands
of Shareware programs right of the box.

Fifth, I don't remember the Falcon coming with a CD-ROM drive?

Sixth, the PC's HD is usually quite spacious - whether its 540megs or
1.6 gigs, you can outstore the Falcon any day and for cheap.

Seventh, the extra Falcon joystick ports are useless! To my knowledge,
there are only a handful of F030 games that use them!

Finall, with a PC - if you're running DOS and Win 3.1 - you don't usually
need more than 8 megs RAM. On the Falcon you only get 4 and you need

to spend a lot of money to expand your RAM if you want more.

Just my two cents...

Ari

WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

Nov 11, 1995 - 1.0

---
1. INTRODUCTION

TECNATION DIGITAL WORLD, the creators of the BiT BOPPER Dynamic Graphics from Audio software for the Atari / C-Lab Falcon are seeking a 3rd party company to take over the development and marketing of this innovative product.

The software is at release 1.5b, which is stable and had been well received by our initial customers.

---
2. YOU

If you think you can take on BiT BOPPER and continue to develop it, and market it world-wide on the Atari / C-Lab Falcon, we would like to here from you.

Requirements:

- You must be competent
- Previous experience with the Falcon
- Previous experience with the markets BiT BOPPER is targeted towards
- You must have the financial resources to further develop and promote BiT BOPPER world-wide
- You must have the ability to create high quality marketing material to backup the innovative and eye-catching nature of BiT BOPPER
- You must have a world-wide web site, or you may use our site to promote BiT BOPPER until you get your own. (The URL for ours is shown later in this document.)

---
3. QUESTIONS AND ANSWERS

- Why is Tecnation looking to pass on BiT BOPPER?
We are now too busy with other ventures, but firmly believe the market for BiT BOPPER is ready for exploitation - which is why we are keen to keep the product alive!

- What are the financial details?
We will require an advance payment, followed by royalties. All negotiable.

- What will you receive as part of the deal?
We will provide our development system, and all source code, documentation
and user documentation.

- What technical support will Tecnation provide?
We will provide some up front technical support to help with any transition.

- What about Mac and PC versions of BiT BOPPER?
This is negotiable.

- What specification Falcon does BiT BOPPER require?
4Meg of RAM and at least 10Meg of hard disk space. Audio input. MIDI IN.

- How many Falcons are their in the world?
Approx 100,000. However, now C-Lab are building them, the installed base
will grow.

- Was BiT BOPPER sold under a different name before?
Yes. Falcon BiT BOPPER was previously sold as SONOVISTA, but not any more.
It is known as VIBRAVISION in Germany, however, we ask the name BiT BOPPER
is used globally to simplify matters.

Source record: 10951

I would like to talk a little about the Falcon's special features
as many people have brushed them off as being worthless.
First of all, the composite TV option is, in my opinion, great.
So you have a copy of Photoshow and you've developed all of your
film on Photo CD, huh? You have a killer slide show produced
complete with music. To show it to your friends, you could
have them gather around your VGA monitor or you could hook it
up to a large television set. Serious presentations at a meeting
could also benefit from this. In fact, Apple sells a presentation
kit that allows Macs to display on a tv. Of course, the biased
people in this group see that Atari did somethin and, so, it must
be bad.
The Jaguar joystick ports are fabuluos. People who knock them have
not used a Jag controller, IMHO. Great games like Llamazap, Steel
Talons, Asteroidia, Bombsquad, Team, Square Off and Frantick (to
name a few) all take advantage of these ports. A four player game
of Super Bomberman is quite a bit of fun, btw. I have never
found an IBM joystick that I like. Furthermore, I have never met a
Mac owner with a joystick.
I do not see how people can claim that the MIDI ports, DSP and
SCSI-II ports are a bad thing. Maybe some people will not use them
but they are good features. I only use my DSP for picture viewing,
MOD playing, and MPEG viewing but just these activities add some
enjoyment to the machine. Audio Fun Machine doesn't exactly suck for
some fun, either.
As far as Tim S.'s post regarding scaling down a Falcon to run at
the PC's level, I have to strongly disagree. Pushing technical
specs aside, my Falcon, for the most part, seems to as fast in most
uses as a fast 486. The sound of the Falcon is also much better.
The ease-of-use is also much better. To make my Falcon act like a
PC, Tim, I would have to rip out my TOS 4.04 ROMS and replace
it with an aggravating, joke of an operating system (Windows).
In sheer computing power, the IBM is a better choice. For fun,
problem-free computing the Falcon is the computer to buy.

> (CompUSA Price)

What for would you need a DSP with connector?

> Plus 3-COM Network Card $ 100.00
> (3-COM Can Cost $135.00!)

Which, unlike Falcon's LAN port is actually useful. There is no
AppleTalk software for Falcon, so its LAN port is not used...

> Plus Future Domain SCSI-II Controller $ 85.00
> (Adaptec Can Cost $225.00!)

IDE would work just as fine, and you can get Fast SCSI-2 for less than
$225

> Plus Reveal Sound Card with Stereo
> Input and Output $ 75.00
> (Soundblaster AWE can cost
> $265.00!)

Which would include MIDI...

> Plus MIDI Connectors $ 75.00

You already got them.

>By cutting corners, then, you can get a '486/66 MHz that only
>costs $102.00 more than a Falcon. But you still won't have
>the extra joyports, the composite TV output, or (in most cases,
>anyway) the Blitter Graphics Coprocessor.

Er, what exactly can you plug into those joyports? Why would you want to go blind with Atari's TV output (which sucked on 8-bit, on ST, and sucks on Falcon just as much)? BLiTTER is just a cute trademark for a graphic accelerator chip that every video adapter has anyway...

>Three years after it's introduction, the Falcon is still the
>better deal.

Pfeh. Even when Falcon was introduced, TT was a better deal. Now, Falcon does not make sense at all.

3099. Re: (300 lines) Cost of Ownership

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-11 00:00:00 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <B5JmiAr.ari2550@delphi.com>
Source record: 10954

Today comparing the Falcon and a current PC clone is like comparing Apples and Oranges.

Having owned a Falcon I know what it can do and what it can't. Likewise, I own two PCs and I know their capabilities as well...

The Falcon is roughly 80% compatible with ST/E software and it runs most of the ST library quite well. However, most of this software isn't modern and you still can't surf the Web in its full glory on it.

The PC (I'm talking 486 and Pentium) has an incredible wealth of software. On the PC, you're not limited to just one or two selections in each program category - you have hundreds! You can surf the Web quite well and the hardware is DIRT cheap in comparision to the F030.

The gap between how easy the Falcon is the use and how easy the PC is to use is rapidly closing. Windoze sucks as an interface but the programmers are getting better and the software is getting more powerful and easier to use.

If you're using the F030 for sound apps - the PC generally can't touch it. However, for anything else - the PC wins.

I love the ST and Falcon but I grew up and learned the a computer is a tool (and a way to earn a living) but not a religion! Hell, I like Macs better than the PC - I just can't afford to pay $5000 for the system I want when I can get a PC for $2200 which has *roughly* the same capabilities. BTW, so I don't get unecessarily flamed, I USE high-powered Macs EVERYDAY at work so I know what I'm talking about here...

3100. Sinclap roots for the BeBox?

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-11 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <483ls8$f85@gti.gti.net>
Source record: 10955

I can't help but feel that I am baiting Sinclap with this, or
that it'll start yet another war, but I've been going thru some old messages
here in this newsgroup, and something that's been in the back of my mind
hit me today. Here is SinClaps .signature:

: BeBox(?)
: Peter Sinclair-Day Macintosh Performa 636
: University of Northern Iowa PowerBook 150
: Graduate School of Library/Curriculum and Information Science
: Http://w3.nai.net/~asincla/home.htm

Now what I wonder is why Sinclap would would root for the BeBox? I am
still unsure of his almost psycotic aversion to Atari; perhaps he
owned an older computer and felt burned, or perhaps he just doesn't
like diversity, or independent thinking?

I admit the BeBox is a very nice machine, and if I had a few
hucklebucks to toss about ($1,600) I would probably purchase one.
Looks like a fun hackers toy. Of course, this is one reason why I
have a Falcon, cause I like to play.

But I feel that the BeBox is fighting an already lost battle. Where
it competes with PC's, PC's have already won. Where it competes
with Macs, it comes closer to the mark, having a couple of PPCs.

So what happens when he purchases a BeBox, and 5 years down the road
find it's not a viable alternative? Will he be in the comp.sys.bebox
newsgroups shouting the same stuff?

But what I am really after here is to understand the twisted mind
that is Sinclap. Who would devote almost his entire existance
to the goal of seeing one company wiped off the face of the earth?
For those who may not have a Jag, he is also in alt.atari.jaguar-discussion
as well as rec.games.video.atari, railing against the Jag, with as much
enegry as he rails against the ST computer line.

I mean, I don't like Ford automobiles, and would never even consider
purchasing anything remotely related for Ford, but you don't see me
in the rec.auto newsgroups. People have a difference of opinion, and
some people like diversity. Not all follow the crowd.

Get real...

Computer Shopper just had a cover feature on 486 DX/4 100Mhz systems for LESS than $999.. read it and weep.

I just happen to have a copy of the Tiger Software catalog (not especially noted for their low prices) open to a page listing Packard Bell Pentium systems... try this one on:

-- 75 Mhz Pentium processor
-- 850 Mb hard drive
-- 4x CD ROM drive
-- 8 Mb RAM
-- 14.4 Fax modem
-- MPEG1 Video system
-- 16 bit sound card
-- Stereo speakers

INCLUDES

-- Windows 95
-- Microsoft Works
-- Microsoft Money
-- Microsoft Design
-- Action
-- FaxWorks
-- Workspace
-- Microsoft Encarta 95
-- Mindscape Reference Library
-- Guiness Disc of Records
-- Sports Illustrated 1995 Almanac
-- Microsoft Entertainment Pack
-- Readers Digest Crosswords
-- The Journeyman Project Turbo
-- Silent Steel
-- Mayo Clinic Family Health Book
-- Better Homes and Gardens Healthy Cooking
-- My First Encyclopedia
-- A bunch more I don't want to bother typing in!

Price: $1649

Delude yourself that your Falcon is better, or faster, or whatever.. but don't try to tell anyone that it's cheaper.

BobR

Since when have you been forced to run Windows on a PC? If I had a PC, I
would probably have it set up with a multiple boot configuration, with DOS
(games), OS/2 (cool GUI environment, compatible with most Windows
software), and Linux (free UNIX).

3112. PowerMac clone price comparison!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-12 00:00:00 UTC
From: sinclap2954@cobra.uni.edu
Message-ID: <1995Nov12.005939.50531@cobra.uni.edu>
Source record: 10967

As usual the Falcon has fallen behind price/performance wise...

PowerComputing the premier PowerMac clone company once again have high quality
and affordable 100% Mac OS compatible PowerMacs.

New pricing: Well at least from MacMall(Macmall.com)

Power 100(PPC 601-100 mhz): includes keyboard, mouse and software bundle.

8/365 $1299
8/840/4x $1699

Power 120(PPC 601-120 mhz): includes keyboard, mouse and software bundle.

8/365 $1499
8/540 $1549
8/540/4x $1699
8/850/4x $1799

However, the Atari jihads will still claim that after all these years that the
Falcon DSP will run rings of anything despite the obvious...

3113. A Fully Loaded Atari Mega 2 ST for sale with 50+ original software

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-12 00:00:00 UTC
From: schiu@crl.com
Message-ID: <486qlc$h0b@crl11.crl.com>
Source record: 10968
Cross-posted to: comp.sys.atari.st,alt.atari,comp.sys.atari.advocacy

My ATARI MEGA2 ST
How much can I sell it for?

Mail me an offer and we can see if we can work something out.
If I get a lot of offers, highest price takes it...OR...if you live close
by, you also get higher priority as well as trades.

Of course, I am willing to trade for other stuff like toys I collect or
anime items, etc...
Stuff like Voltron, Macross, Gundam, Visionaries, any old japanese toys, etc..

If this is the wrong group for this, then please point me to the correct one.
I don't believe there is an atari.st.marketplace.

Here's the run down:

Hardware:

Atari Mega ST2 Comes with Internal Floppy drive and mouse and keyboard
Atari SC1224 Monitor (color, old model, made in Japan the "better" one before
they started using the cheap parts one from Malaysia or something...)
Atari SF314 Floppy drive External
2 EPYX 500XJ Joysticks (very tough, uses a STEEL shaft)
All cables...

Software: (all are originals with docs and box unless otherwise noted)
(Condition of box and docs are usually Excellent too)
(a * means I have actually loaded this and made sure it
works)

1 Hex Mark of the Unicorn *
2 Death Sword EPYX *
3 Starglider EPYX *
4 Questron II SSI *
5 Demon's Winter SSI *
6 Final Assault EPYX
7 Winter Games EPYX *
8 Wizard's Crown SSI *

[SNIP! - removed pages of tripe and un-wise shopping]

YOU IGNORAMUS BUMBLEF*CK!!! I have some simple comments.

1) How many times have I mentioned the $999 DX4/100 systems in the November 1995 Computer Shopper? How many times? Once again, how many times have I mentioned the $999 DX4/100 systems? You DUMBASS!!!!!!! It's very convenient for you to "forget" about this. LOOK ON THE COVER OF THE LARGEST COMPUTER MAGAZINE YOU CAN FIND!!!!!!!!

2) Don't "remove" the CD-ROM from the PC. THe CD-ROM is a very well-utilized piece of hardware. You say "for Falcon equivalency" and take off $75. Why not add $200 for an external CD-ROM for the Falcon instead? Oh, and don't forget the "SARA" software so you can run a few of the popular MS-DOS titles since you won't find many for the Falcon.

3) Quit making yourself look like a complete moron by adding the cost of SCSI cards to PCs that come with EIDE. Hard drives, tape drives, and CD-ROMs can be run without SCSI. If you're building a SERVER with lots of drives, then SCSI may be the way to go. With IDE, you plug it in and turn it on and don't have to F*CK with terminating resistors and LUN numbers....ok? We're talking desktops here. How many Falcons have been used as servers? So let's compare DESKTOP PCs to desktop Falcons and leave the SCSI/IDE debate to the server market. SCSI is fine in a desktop too, but the increased cost and complexity is not worth it for many desktop users, including this one who demands (and receives) high performance from EIDE. Your friends may have trouble with IDE and tell you it sucks but they are probably pricks like you and you're dumb enough to believe them. So it's my word (IDE works) against yours (IDE sucks, as per your friends) and anybody (namely you) is dumb enough to believe that his Atari Falcon is faster than a DEC Alpha is obviously whacked enough to believe such lies.

James

: -- 75 Mhz Pentium processor

Well considering the Pentium is Intels NEW chip then it should be faster
than an old Motorola chips. Having said that the Falcon does offer all
the power most users will need. Also we had pre-emptive multitasking
3 years ago (Winshit '95 only came out recently) and we can also CHOOSE
which OS we want to run, without having to ditch all our old software. For
example we can go from MultitiTOS/Mint to MagiX, run most of the old
software and experience HUGE speed gains, I doubt this is true of
any Windows based PC. Just try running Windows 3.1 as opposed to '95
on an 8meg 486/33 PC.

Nope... ESCOM is German. They own the Amiga for nearly half a year now.
Nobody can expect from ESCOM to set up the old product line and create
a totally new one in such a short time. It is a miracle that they really
produce A1200 since two month now!

But new PPC Amigas are planned, and i saw a PowerPC processor board for
the Amiga yesterday on the Computer'95 fair in Cologne. They say PowerPC
will be available in about half a year for the existing Amigas!

Why not getting an Amiga with Atari and Macintosh emulator? You'll have
THREE systems for a very low price.

A) Your insulting comments add little to your argument.

B) I don't recall ever reading any post that claimed that the Falcon was faster than an Alpha-equipped computer (the DEC Alpha, BTW, is a chip, not a computer, so the comparison smacks of strangeness to begin with).

C) A few individuals made simple observations about a single iteration of a simple test. Why this has grown into such a strange debate, with you ," and having the audacity to assume that most
Falcon users think that their machines are faster than Alpha-equipped computers, is probably more of a legitimate debate.

Well the graphics issue of you compare an ST and Amiga500 is certainly
true but when comparing the A1200 and Falcon the situation changes
quite a bit. In terms of number of colours the A1200 certainly is
better, but when you add the Falcons DSP in, the speed of the graphics
probably blows the 1200 off the face of the earth.

The DSP is also useful for sound and other applications.

This i sonly going to be of interest to Boston area ST/TT/Falcon owners;

I was pleasently surprised to find, about two weeks ago, that my employer (Micro Center) is now carrying ST Format! At this point we are only receiving 5 copies per month, and I am the only person buying one! Anyone interested should stop by and pick up a copy to help ensure that we continue to carry this product. It is a nice glossy rag from Europe with a fair layout and reasonably good articles, plus a cover disk. We also carry a few Amiga magazines if anyone is interested.

BTW, this is not meant to be an advertisement for Micro Center, just an errrr. public service announcement, yeah, that's it...

It is interesting the number of comments my little Atari emblem on my name badge gets. The most common comment goes something like "Wow, Atari, I still have my ST and love it" or "I wish I could still get products for my ST, it was much better than my PC is." I have even been doing some Technical Support for the ST/TT/Falcon line (usually I do Mac Tech Support). Heck, if you have a question about your system stop by and see me - I work in the Tech Support department.

Long live Atari!

When I meant more colours I simply meant in terms of numbers. Yes,
you are right to point out the falcons TC display is MUCH clearer.

About 18 months ago I had a choice A1200 or Falcon, I suppose my
presence here says which path I chose. At the end of the day, if
you want a fast, hi-spec machine then the Falcon is a better buy.
All the apps you need ARE around, its just the lack of specific games
which is a problem.

It is true that the Falcon has a slightly poorer OS, but simply upgrade
to Magic 4 when it comes out and aswell as having an Amiga beater you'll
also put many PC's to shame.

comp.sys.atari,comp.sys.atari.st,alt.atari,comp.sys.atari.advocacy,ba.marketplace.computers,comp.sys.amiga.marketplace

Highest and only offer is 250...

My ATARI MEGA2 ST
How much can I sell it for?

Mail me an offer and we can see if we can work something out.
If I get a lot of offers, highest price takes it...

Of course, I am willing to trade for other stuff like toys I collect or
anime items, etc...
Stuff like Voltron, Macross, Gundam, Visionaries, any old japanese toys, etc..

If this is the wrong group for this, then please point me to the correct one.
I don't believe there is an atari.st.marketplace.

Here's the run down:

Hardware:

Atari Mega ST2 Comes with Internal Floppy drive and mouse and keyboard
Atari SC1224 Monitor (color, old model, made in Japan the "better" one before
they started using the cheap parts one from Malaysia or something...)
Atari SF314 Floppy drive External
2 EPYX 500XJ Joysticks (very tough, uses a STEEL shaft)
All cables...

Software: (all are originals with docs and box unless otherwise noted)
(Condition of box and docs are usually Excellent too)
(a * means I have actually loaded this and made sure it
works)

1 Hex Mark of the Unicorn *
2 Death Sword EPYX *
3 Starglider Rainbird *
4 Questron II SSI *
5 Demon's Winter SSI *
6 Final Assault EPYX
7 Winter Games EPYX *

Ari Feldman (ari2550@delphi.com) wrote:
:
: What are you smoking?!? The Falcon a better deal than a 486DX-66???

James Woods asked me to compare similarly-equipped computers
to make a price comparison. After adding all the missing
Falcon stuff, the 486/66 MHz was more expensive.

: First of all, you need to learn how to shop for a PC.

Rule #1: If it isn't included in the ad, it's an extra-cost item.

: You almost never go to a chain like CompUSA - their prices suck.
: PCs are the most generic computer ever made. The only difference between
: a $2000 Compaq and a $1000 Taiwanese clone is that you're paying for
: Compaq's marketing and advertising. As long as you verify the components
: in the clone PC to be good (i.e. the HD maker, the BIOS, the CD-ROM, etc.)
: you're in good shape. PC's don't fail very often and on-site service is
: almost always a waste of dough.

In fact, PClone sellers are now claiming that the no-name machines
are much higher quality than the name-brand machines (or so I was
told over the weekend at my favorite PClone dealer).

: Pickup a copy of ComputerShopper and shop around - there's a ton of vendors
: that vary in price so shop around. I know for a fact you can pick up
: a DX-66 system for well under $1200 fully equipped.

Again, James Wood has been telling me the joys and wonders of shopping
locally. So I looked in a local version of the Computer Shopper.

: Second, there's no question the Falcon has better built-in sound than the
: usual SB-16 card one gets with their PC Clone. However, unless you're
: a professional musician and have the expensive, specialized software to
: take advantage of it - its no advantage. Almost every PC game and every
: PC CD-ROM take advantage of the sound cards.

But for comparably-equipped systems, the general-purpose DSP with
port must be included.

: Third, unless you get ripped by the PC vendor, the PCI or VLB SVGA card
: you get bundled with your system will almost always be accelerated with
: a co-processor. This is in the very least eqivalent if not superior to
: the Falcon's much heralded BLiTter chip (which is just a hardware version
: of the TOS Line-A memory-move command).

That's right, it *is* the hardware equivalent of the Line-A memory-move
command. In fact, the OS code for the software equivalent was removed

from the ROMs when the Blitter became a standard part of the architecture.

Since there has been a lot of improvement in PClone video lately, I
figured that it wouldn't be necessary to add an equivalent to the
Blitter chip.

: Fourth, the Falcon may or may not be easier to use but its limited in
: what it can do in terms of software selection. With the 486DX-66, you
: can run the 30,000 or so commercial PC programs or the countless thousands
: of Shareware programs right of the box.

There was a previous posting of many software categories that
theoretically had *no* available software on the Falcon. I
demonstrated that all but one (the automap function) WAS available
on the Falcon, and I suspect that the automap program is available
in England.

It has also been noted that because of the intense competition
among software suppliers on PCLones, "unfinished" bug-ridden
products tend to be rushed to market, requiring frequent upgrades
and bug-fixes.

: Fifth, I don't remember the Falcon coming with a CD-ROM drive?

That's right. And that's why I delete it's cost from the '486
systems for fair price comparison purposes.

: Sixth, the PC's HD is usually quite spacious - whether its 540megs or
: 1.6 gigs, you can outstore the Falcon any day and for cheap.

Windows95 requires 55 Megabytes of hard drive space (but would like
to have LOTS MORE!) for proper operation. GEM not only doesn't need
a hard drive at all, but it works just fine with only a single floppy
attached. Mention that to the PCloners and some of them will just yell
"LIAR!" because they just can't imagine a useful computer without one.

: Seventh, the extra Falcon joystick ports are useless! To my knowledge,
: there are only a handful of F030 games that use them!

I did point out that the four joysticks (two digital, two analog)
were somewhat controversial, and did not attempt to add the three
extra cards to get them on the '486.

: Finall, with a PC - if you're running DOS and Win 3.1 - you don't usually
: need more than 8 megs RAM. On the Falcon you only get 4 and you need
: to spend a lot of money to expand your RAM if you want more.

Windows REQUIRES 8 Megs of RAM for proper operation. GEM does not.
Previously, I mentioned that source code shrinks by about half when
compiled on the Falcon, but doubles in size when compiled on the
PCLone. This four-to-one ratio implies that 4 Megs of Falcon RAM is
equivalent to 16 Megs of PClone RAM. Since the ratio isn't exact,
and because storage requirements vary from application to application,
I've been giving the 486's the benefit of the doubt and accepting

8 Megs of RAM and 540 Megs of hard drive as equivalent.

: Just my two cents...

And expressed with clarity of thought! It's good to have you in
the discussion.

-- George

<sinclap2954@cobra.uni.edu> writes:

>A A3000 with its multitasking capabilites blows away the Falcon. Plus with its
>slots, you can instal graphic video cards and 040 boards.

When I was looking at getting a computer (upgrading), I had the choice of
going with the Falcon030 (and hence the Mega ST route), or stick with
my A1000 (and hence, get an A1200 or A3000).

My primary applications that I use for my business here are Papyrus, Calamus,
and, for interactive presentations, APEX. The Amiga 3000, at the time, lacked
those applications, and the A1200 was simply slower, flimsier construction.
And I also considered the future of the market. At that time (and at the
present), Amiga had one manufacturer: Commodore (now it has Escom). The
Falcon/TOS
market has many manufacturers, including C-LAB, Lexicor (or whoever makes the
Medusa for them), GE-Soft, and a number of others who are entering the market.
For me, the choice was clear.

BTW - The video toaster never fit in the Amiga 3000 without bending the case
(and voiding the warranty in doing so). And the ddisplay speed and color
depth of the A3000, replete with the Amiga's complete inability to provide
a stable, hi-res, flicker-free, compatible resolution, greatly limited
(limits?)my use for it.

>I meant the Toaster 4000 card only...

Irrelevant. If I want to do Video Toaster stuff, I'll need a fast 4000T
with a load of memory. If I want to do publishing, stable graphics work,
photo retouching, and general business apps, the TOS computer line wins
in software quantity and quality, hands down. It's that simple - the Amiga
is a great hacker's machine, and produces great multimedia stuff, but for
any practical business, math, word processing, and DTP, it is the worst
machine in the pack.

You don't even know ANYTHING about this benchmark other than some results
that Atari (and noone else) claimed. The entire industry ignored
Atari's claims as they've come to recognize that most of what the company
says is bullsh*t. Anyway, back to my point: You don't know ANYTHING
about this so-called "benchmark" now admit it and SHUT UP about it.

I LIKE IT! Just so someone knows. I want a computer that looks different from other computers. BeSides (no pun intended) it's a great way to get people to ask the question, "what is that funny looking computer?". After all, it's really not UGLY maybe just a little gaudy. (Ugly would be puke green, with brown/orange spots)

Press release.

To satisfy both exhibitors and users, Composcan France and Oxo Concept
are proud to announce that they finally found an arrangement.
Composcan France has agreed to cancel the " Atari Show 3 " and has
decided to join and support the " 1St forum of Atari Applications ".

We believe that this decision can only benefit to the Atari community
and will help the Atari world to find a new enthusiasm.

The " 1st forum of Atari Application " will take place on the 16th and
17th December 1995 in Paris (Porte de Versailles). We encourage all
Atari actors to participate and support this show so it can become a
major international event.

For more details about the show, please contact OXO Concept or
use OXO's Homepage (http ://www.oxo.ch).

Composcan France and Oxo Concept.

No, as you'll clearly remember (thought I'm sure you'd like to not
admit), I proved that you were wrong on many accounts - from your dumb
assumption that the INCLUDED operating system should tack $180 onto the
price of the system (which alone is over half of you "alleged Falcon
price difference") - to your assinine assumption that the PC must need a
"Jaguar joystick port(s)" to play games on....heh heh. Look at all the
successful PC game players out there. Then continuing to claim that you
don't know of any decent PC joysticks. Wake up and smell the sauder.
Yes, if cheap little Nintendo-style controllers (Jag controller like
Nintendo with keypad) are what bring you off, you can get one. Walk
in to any decent electronics SUPERSTORE (like "The Incredible
Universe") and you'll see more joysticks, flight yokes, even driving
aparatus and floor controls, etc...and funny that they all function just
nicely without "Jaguar Joystick Ports." (hereby known as "JJP" for the
duration of this post for sace considerations) You see, you built up a
bogas list of addons (like Windows and JJP and even adding on for SCSI
cards for EIDE machines that wouldn't need to plug anything into them.)
By pretending that the PC needed to be "charged for" a list of features
that it already had (like charging for the inputs on the sound card,
charging for Windows, etc.) and didn't need (JJP, a 16mHz DSP when it
has 100mHz cached CPU/FPU) and by such tactics as deleting the PC's cheap
plug-in CD-ROM to avoid having to implement a costly and bulky Falcon
external solution and by EVEN COMPARING A 4MB/350MB FALCON SYSTEM TO AN

8MB/540MB, you came up with the most inaccurate, ridiculous thing I'd ever read. You'd nearly DOUBLED the price of the DX4/100 system to try and make a Falcon look like a bargain. I'm surprised that after all the replies you got, you're still oblivious to the fact that nobody could possibly take such nonsense seriously - yet you bring it up again now as if you hadn't been shot down on many points of that arguement. You must have an incredibly thick cranium, son.

No, you got it all WRONG. That $999 included A QUAD SPEED CD-ROM IF YOU WERE SMART ENOUGH TO COMPREHEND AND MEMORIZE THE THINGS THAT WE'VE BEEN SAYING!!!! How many times now have I mentioned that $999 system and referred you to November 1995 Computer Shopper? I put the question to you: How many times? Yet you post DUMB INACCURATE things like this and then call me biased. You are an extremely ungifted debator. Before you even hit that Reply key, I suggest you familiarize yourself with Computer Shopper so as to try and post SOMETHING accurate about PCs of which you know ABSOLUTELY NOTHING!!!!!

> Mark II uses SCSI. Additional drives and peripherals (scanners,
> laser printers, etc.) all use the SCSI port. For equivalency, the
> '486 must be equipped with a SCSI port.

NO NO WRONG ONCE AGAIN. "For equivalency" a computer only need work with its perhipherals. Since I can have an EIDE system and not miss out on a thing, it's already equivalent. Plus, the fact that I've got PCI slots that can controll anything **MORE** than compensates for your limited SCSI interface and one-drive IDE. You see, PC's EIDE is a hell of a better thing that Falcon's one-drive IDE. Scanners/etc can plug into an ISA slot. So truly "For Equivalency" (if one follows your stupid

contention) then if a PC needs a cheap SCSI card then a Falcon needs a PCI bus, which is both ridiculous and impossible. But since in the real world each computer will successfully operate its drives and peripherals (with hopefully equivalent success) then LET'S DROP IT!! Let's ignore the fact then (in favor of dropping it) that the PCI and ISA slots are still there on the PC).

>
> SCSI is also faster than IDE, at least as implemented on the Atari.

(Yawn!) This is tiresome. Neither SCSI nor IDE have ONE speed. It varies depending on the equipment and type. Both have been constantly improved (at least on the PC). However, what I can assure you is that a good PCI EIDE on a 100mHz PC blows away any disk performance the Falcon can achieve. If you *really* want to go into numbers, then we can research this but it will just end up proving you wrong.

>
> : With IDE, you plug it in and turn it on and don't have to F*CK

> : desktops here.
>
> I've never had to do anything with terminating resistors on my
> SCSI network, and LUN numbers are a lot easier to work with than
> the jumpers you find on PClone motherboards.

I had to the day I decided to daisy chain two SCSI devices. NOW YOU WANT TO ARGUE AS IF TERMINATING RESISTORS DON'T EXIST. The jumpers on "PClone" motherboards allow PC users to do lots of things you WISH you could do on your Falcon like change CPUs, clock speeds, etc. THE TERMINATING RESISTORS AND JUMPERS AND DIP SWITCES TO CHANGE THE DRIVE ID (etc) IS ON THE DRIVE, YOU MORON, NOT ON THE PC'S MOTHERBOARD!!!! Gees someone get this man some help.

>
> : How many Falcons have been used as servers?
>
> Falcons are personal computers.

My point exactly. The $999 DX4/100 is a "personal computer" so it doesn't need the ability to chain 14 drives when you can get 1.62gig EIDE drives easily.

>
> : So let's compare DESKTOP PCs to desktop Falcons and leave the
> : SCSI/IDE debate to the server market.
>
> Since SCSI allows a variety of peripherals to be easily connected
> to the computer, it's not wise to limit SCSI to the server market.

"It's not wise?" You need it on your Falcon but scanners/etc can plug into a card slot the PC. The end arguement: your peripherals work on your Falcon and PC perhipherals work on a PC and regardless of interface,

they work. Ok?? NOW SHUT UP ABOUT IT!!!

>
> : SCSI is fine in a desktop too, but the increased cost and complexity

> : (and receives) high performance from EIDE.
>
> If you can handle an AUTOEXEC.BAT file, you can handle LUN numbers.
> From a complexity standpoint, it shouldn't be that much of a problem.

The debate is between SCSI and IDE. AUTOEXEC.BAT has nothing to do with it. The fact of the matter is that IDE is easier to use. Damnit, I've been there and use both and I speak from experience. IDE is more limited (but PCs have other things than IDE) but SCSI is more complex. NOW SHUT UP!!!!

>
> : Your friends may have trouble with IDE and tell you it sucks but

No, you already look like an idiot. You couldn't stand by that s*it anymore and make yourself look worse if you wanted, so save your time. The correct question to ask you, however, is "Do I need to post ALL THE REPLIES that shot down that bencmark?" I have a good idea. Let's break this "Falcon is faster than a DEC Alpha" into its own thread and cross-post it to a "microprocessor newsgroup" and watch you fall on your ass.

: You can state that YOU believe it is not underpowered
: nor overpriced, just as YOU believe that the Atari Falcon is more
: powerful than a DEC Alpha. You'll be hard pressed to find people to
: agree with you, however.

Around 1993, when Digital Equipment Corporation was unveiling their
Alpha machine, it was running the Mendelbrot benchmark in 5 seconds.
Several hundred feet away, at the same trade show, the Atari Falcon
was running the same Mandelbrot benchmark in 4 seconds. When
comparing this benchmark result, the Falcon shows it's power.

In response to your request that I show prices for comparably
equipped '486s and Falcons, I showed that the '486s cost anywhere
from $100 to $400 more when they were equipped with the missing
Falcon hardware. The standard Falcon hardware, BTW.

Based on these facts, then, it has been proven in my opinion that
the Falcon is *not* underpowered and it is *not* underpriced.

: I would like to find an official record of that benchmark published in a
: printed journal that I can look up in our extensive university library.

I do not know of any printed journals that keep records on trade shows.
Have you considered a search of the Lexis/Nexis database?

Very poor analogy. Whether or not the earth is round or flat is an absolute quality that can be measured and proven. Since it has already been proven, then what you say about it has no bearing. What hasn't been proven is that the Falcon is a better bargain than a PC - in my opinion and the opinion of others, it is quite the opposite.

Just tell me THIS: Evidently, all of my messages have been making it to your site because you reply to them. What about all of the messages written by other people that have addressed this "benchmark" and why it is not an accurate comparison? Why do you (like a stupid signpost who can't argue logically) just repeat this benchmark sh*t after it's been dismissed? I don't understand you.

>
> In response to your request that I show prices for comparably

No, you made up a bunch of stuff that you thought you'd add to the price of the PC, and you compared the PC to a Falcon with half the memory and hundreds of megs less hard-drive space. Many people (including myself) told you WHY your "PC pricing" was grossly in error, and yet you come

back with this same $100 to $400 - still charging for the PC's operating system after you were TOLD that it's included in the $999 DX4/100 system. Once again, I question the intelligence of anyone who ignores all that has been said about this yet continues to spout the same stuff. You're too ignorant to use a logical means to convince others of your case, but then again, your case is *completely illogical*; anyone who *truly* believes (as you do) that their Falcon actually is (regardless of what Atari tells you in a SIMULATED "benchmark") is an absolute fool. You are exactly the type of FOOL that Atari had in mind when they dreamed up that bit of pseudo-false advertising. While I must dismiss the "benchmark comparison" as bullsh*t, I must commend the claim on its ability to influence the unlearned such as yourself.

>
> Based on these facts, then, it has been proven in my opinion that
> the Falcon is *not* underpowered and it is *not* underpriced.

If it were based on facts, but in fact it has not been based on facts but based entirely upon bullsh*t. An Atari advertising claim about their Falcon completing a benchmark faster than a DEC Alpha is NOT A FACT. It is a claim. To be a fact, such results would come from more sources than ATARI!!! ARE YOU TOO STUPID TO KNOW A COMPANY TRIES TO PLAY UP THEIR PRODUCTS??????? It is NOT POSSIBLE for a Falcon to outperform a DEC Alpha in a true test of computation. It is possible to write a program that simulates that it is. As Tim Sefert said, it is not a true test of raw computing power but a different exercise in algorithm development. Now quit trying to call your ridiculous claims and contentions "facts" and back off on the arrogance a little. It is certainly possible that you are wrong, thought you're too arrogant to admit it.

>
> : I would like to find an official record of that benchmark published in a
> : printed journal that I can look up in our extensive university library.
>
> I do not know of any printed journals that keep records on trade shows.
> Have you considered a search of the Lexis/Nexis database?

No, you see if the Falcon **really** was faster than the Dec Alpha and every PC and Macintosh as you claim (I'm not sure even you understand the magnitude of your claim) then it would be BIG NEWS and the Power Pc would never comeout and Intel, IBM, Dec, Apple, and everyone would be out of business now because it was revealed that a 16mHz 68030 plus DSP laid everything else to waste. Not just an Atari advertisement, but other independent labs and testers would all be amazed at the sheer power of the Falcon and baffled by its ability to smoke a Dec Alpha, which costs big thousands of dollars. The Falcon would be front cover news on all of the computer magazines and even newspapers as a breakthrough in desktop computing power.

Now, I'm getting tired of wasting time on you, because you must *really* be the simpleton that I accuse you of being if you don't understand and won't admit that if the Falcon ***really*** __really___ !!!really!!!

could outperform a DEC Alpha then the above scenario would be true. You know it. I know it. The fact of the matter is that ALL YOU HAVE IS AN ATARI CLAIM!!!!

Equally outlandish is that YOU are the one SPOUTING OFF about the claim, you seem to know almost nothing about it, you use it as evidence to support your completely absurd contention of the Falcon blowing away a Dec Alpha, and then have the audacity to COCK OFF about "have I considered the Lexis/Nexus database." Boy, it never crossed my mind because I know that what I'd bee seeking is bullsh*t and nothing more than an inaccurate Atari lie which was meant nothing more than to reach its target - a simpleton like you for whom Atari is a religon and every Atari claim is the gospel. Sorry, I don't agree, I'll never agree, and I think the subject is getting stale. Before we continue this discussion anymore, let's narrow it down to the Falcon and the Dec Alpha and let's cross-post it with a microprocessor discussion newsgroup. I don't believe your Alpha-beating Falcon claim, and you're obviously not intelligent enough to discuss microprocessor logistics (I'm not saying I am, but you're the one asking others to believe the impossible) so we need people who know more to set you straight.

3155. Jaguar vs. Falcon

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-16 00:00:00 UTC
From: mrathwel@uoguelph.ca
Message-ID: <48e3nl$4ui@ccshst05.cs.uoguelph.ca>
Source record: 10910

Now to play devil's advocate. Why the heck is the Falcon so expensive?
While I like the computer and would love to have one, $800 is ludicrous.
I mean, compare it with Atari's own Jaguar.

Jaguar Falcon
======= =======

RAM: 2 MEGS 1 MEG
Speed: 27 Mhz 16 Mhz
Colors: 16.8 million 256,000
Processors: 16 bit MC68000 68030
32 bit RISC DSP DSP
32 bit RISC processor
two 64 bit RISC processors

Price: $150.00 $799

This isn't intended as a flame. But seriously, considering that
the Jaguar has more under the hood than the Falcon (in terms of number
crunching, RAM and graphics power), the Falcon should be priced a little
lower.

It's a comic compared to Atari World. STF still carries the ST Review
logo on it's cover, but all the STR writers went to AW. Get your store
to stock AW and do all your local Atarians a BIG favour.

All this IMHO of course (but I am right).

Out of the three operating systems listed, Linux is by far the worst to
install and configure. However, setting up a machine to dual-boot OS/2
and DOS is no worse on average than Windows.

The TT, so far as I'm aware, could not be bought in autumn '89. Wasn't it
about '91 or '92 before it finally became available?

Even if it had been available by '89, it would still be a clear case of
Atari dragging its heels too long. Apple introduced the Mac II around
1987. By the time Atari got around to introducing a competitor, the Mac
II (and several follow-on machines) had already been on the market for a
couple years. And the machine Atari brought out wasn't as good - you
might make a case for it being faster than some (but not all) of the Mac
II models, but in terms of video resolution/colors and expandability, the
TT is junk. Yeah, sure, those Macs were quite expensive, but Atari needed
to compete in the high-end market as well as the low end, IMO.

You seem to be using meaningless performance ratings here. 500 Megs per what? Second? Minute? What precisely do you mean by "Megs"?

FYI, SCSI as implemented on Ataris is limited to 5 MB/s. (None of the machines, so far as I'm aware, does anything better than standard SCSI-II, so you have a 5 MHz 8-bit bus. That means 5 MB/s.) EIDE, on the other hand, can transfer well over 10 MB/s, and there's no command overhead to increase seek times (SCSI has a 1 to 2 ms command overhead on every operation). The cost of an 850 MB to 1 GB EIDE drive and controller is really quite small.

Wrong, wrong, wrong! You flunk the class; try again next quarter.

It might almost have been a valid benchmark had Atari taken DEC's source code and changed it enough that the core Mandelbrot calculation could run on the DSP. There is at least one C compiler that generates 56001 code, so it would have been possible. It would have still been somewhat bogus (since the 56001 would have to use fixed-point math instead of FP, and thus you'd be comparing apples and oranges), but it would have been a better comparison than what actually happened.

Atari did not use DEC's code in any way. They wrote their own code to draw Mandelbrot pictures. We have no guarantee that the algorithm, regardless of the number system being used, is the same (very important!). We have no guarantee that the parameters that can drastically affect the running time of Mandelbrot generators were the same (number of pixels, maximum iterations per pixel, and the exact part of the set that's calculated).

Benchmarks can be customized to take advantage of special hardware. However, they cannot be rewritten from the ground up with no use of the original source or algorithm.

Why would you want a single-CPU BeBox? The whole point of is to have at
least two processors, which greatly benefits an OS that's designed to be
multithreaded from the ground up.

Actually, I wrote a Mandelbrot generator for my 800XL, once. Programmed
it in Action! and used mode 15 (160x192 with 4 colors, if memory serves).
Trust me, despite the lower graphics resolution and color depth, ain't no
way an 800 is going to beat anything relatively modern on a Mandelbrot
test. :-)

MIPS is a meaningless comparison across processor families; it only applies within a family. It would be perfectly valid to use MIPS when comparing a 68030 to a 68040 on the same code, but not for a 68030/486 test.

>dissimiliar systems' performance. Blame DEC for the benchmark.

Why should anyone blame DEC? The entire point is that the program run on the Alpha was *not* the same as the program run on the Falcon. Algorithmic differences make any such comparison meaningless -- in order for a benchmark to be a benchmark it has to be standard across *all* platforms, and as was stated in an earlier article, it was not.

Here's why your logic is faulty: Suppose I want to compare two machines that are completely identical except for the fact that one machine is using a processor clocked at 32MHz, and the other is using a processor running at 8MHz.

Suppose I want to evaluate the differences in the speeds of the machines by comparing the time it takes to search through a list of 1 000 000 names. On the 32MHz machine, I search this list of 1 000 000 names using a linear search. This algorithm has a worst-case execution time of order n. If we assume the machine can look at one element of the list and determine if there is a match once each clock cycle (an unrealistic assumption) then in the worst case, the search will take approximately 1 000 000 comparisons/32MHz ~= 31.25 millisecs.

Now, we run the search on an 8MHz machine, but this time we search the list of 1 000 000 names using a binary search. A binary search has a worst-case execultion time of order log2(n). If we also assume the processor can compare one element for each clock cycle, then in the worst case, the search will take log2(1 000 000)/8MHz ~= 20/8MHz = 2.5 microseconds.

We just compared two machines using the same processor -- one at 8MHz and one at 32MHz. By your logic, the 8MHz machine is faster than the 32MHz machine even though the 8MHz is slower! Does this explain to you why the algorithmic differences make your DEC-Atari "benchmark" meaningless? Because unless the algorithms are the same, it's more than likely that any differences can be attributed to the differences in the *algorithm*, not the processor.

Dave,
Since when did this benchmark become "mine"? I don't recall rabidly defending it one way or the other.
DEC should be blamed because they set themselves up for humiliation. They said that the Mandlebrot generator was a valid way to compare the power of dissimlar systems. It seems reasonable to me, that a competitor such as Atari would want to show them up. So, they wrote up a program that allowed them to do the same number of iterations in 16-bit color. According to Bill Rehbok, people from DEC took notice of Atari's demonstration :-).
My whole point is that people here are making this benchmark sound like it was conceived and orchestrated by the evil and dasterdly Atari Corporation. However, it was DEC's brilliant idea. If DEC wanted a "fair" comparison, they should've ran the program on a Falcon themselves.
Rehbok called the benchmark "loaded." The feeling I get on this group, though, is that if DEC makes a claim it must be true but Atari, on the other hand, only tells lies. In a way, it was Atari that was proving the pointlessness of another company's benchmark (because, yes, the Falcon is less powerful than an Alpha in raw power). This is not a good thing? Or should we accept DEC's word as gospel as well as Microsoft?

It wouldn't be a terribly bad example if, aside from the initial UI
code (making widows, etc) the source code was exactly the same.

Heh heh heh. Scott, what hole have you had your head up? I suggest you pull it out and wake up. It's not me who's been touting this benchmark and claiming that the Falcon is faster than the DEC Alpha, it is George Crissman, who brought the whole situation up. He says his source of information is an Atari Falcon flyer. So you if you want to accuse someone of making up lies and posting assumptions (you presumptuous little wank) then I suggest you attack George Crissman.

There. Now I feel better, for your information.

James

3173. Saw Jag CD

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-17 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.951117224105.10739A-100000@PEAK.ORG>
Source record: 10928

I went back to "The Incredible Universe" and they had Jag CDs on display and even Hover Strike on CD as a demo. It was good to see that there's at least one game on CD now, but too bad it was Hover Strike. The graphics didn't look any better than games I played on my ST 10 years ago - the game reminded me of "Rescue on Fractalus" - a good game on the Atari-8 from years ago. Sure seems like they could have done more.

However, there were more Jag games on the wall than I'd seen before, including Pitfall Mayan Adventure, etc. Hover strike was on ROM too, so perhaps there's still little benefit to the Jag CD. I still think about getting a Jag but I wish they'd have an all-in-one unit with CD in it for less than the Playstation. As it is now, a Jag + CD costs as much as a Playstation and those Playstation games are pretty kick-ass. Anyone know if there's a combo unit in the works?

Yep, but I don't want a new A1200 for the money.

>But the A1200 will have a future because Amiga Technologies will provide a PPC
>upgrade card solution for it in 1996.

C= had also announced many upgrades and boards. RTG, the DSP board, etc..

>Amiga OS will be ported to PPC through
>partnership with Apple, IBM and Mortorola...

Sorry, but yet I don't believe that. I guess it's just a kind of marketing
trick to make Amiga owners hang on to the outdated machines they sell
right now.

>Plus all new PPC machines will also be available in 1996..

Time will tell if they do. Escom is not a developer, it's a company
throwing together PC hardware to bundle them with loads of OEM software.
Any small PC dealer builds better machines of higher quality parts.

James,
You don't call people names unless you are called them first, huh?
Where did I ever call you a name? Interesting. I find it funny
that you critique others' debating skills when you so often resort
to childish name calling. Quite frankly, if you are not mature
enough to not get so emotionally involved in a discussion on
computers than you'd be doing everyone a favor by just keeping
quiet. I really didn't think my "take a deep breath" comment
was out of line considering I was following up to your post that
was sprinkled with name calling and explanation points. I think
that you might be taking these postings a little too seriously.
I apologize to others for having to read this. I was just a little
peturbed to be called a "little wank" with, what I felt, no
provocation.

There are a few Q850's floating around. Saw the ads in MacWeek..
My 630 runs fine with the apps. Just because I don't have PCI yet doesn't make it obsolete. If you follow your logic than the Falcon is way obsolete!

The Atari didn't compete in any benchmark. It simply ran a program that did
a similar thing to a program on another computer. In order for a comparison,
there has to be standardisation. There was none -- we have no idea how
different the alogrithm used on the Falcon was from the one used on the Alpha.
The fact that we can't guarantee that both machines used the same algorithm
renders any such "test" useless.

>I am willing to admit that I do not have all the facts relating to

When you get the time, respond to my article in which I describe a thought
experiment that proves, using your logic, that an 8MHz processor is faster than
the same processor running at 32MHz.

>DEC took notice of Atari's demonstration :-).

DEC was not humiliated -- anybody who thinks about this so-called benchmark
will realise (yes, I admit that sounds sarcastic, but I don't mean it to be--
I'm just tired and don't want to spend time re-phrasing things) will realise
that this demonstration is totally invalid. The entire point of the article
of mine to which you just responded was that algorithmic differences render
such a test totally meaningless. Why should DEC be humiliated by such a
meaningless demonstration?

>My whole point is that people here are making this benchmark sound
>like it was conceived and orchestrated by the evil and dasterdly
>Atari Corporation. However, it was DEC's brilliant idea. If
>DEC wanted a "fair" comparison, they should've ran the
>program on a Falcon themselves.

It also has nothing to do with DEC or Atari being evil. It has to do with
certain people on this group not understanding the most basic concepts in
Computer Science. As for DEC wanting a "fair" comparison, I don't think DEC
has much to worry about from Atari.

> In a way, it was
>Atari that was proving the pointlessness of another company's
>benchmark (because, yes, the Falcon is less powerful than an
>Alpha in raw power). This is not a good thing?

But no benchmark occurred -- it was simply two companies running programs
that did the same thing! How can this demonstration have been a benchmark
when there was no guarantee that the algorithms used were similar to each
other?

Out of all the things you've posted, this takes the cake. Remove those rosy glasses, and take a look at the real world. 16 MHz 68030 systems with 16-bit data buses and a mediocre DSP just aren't as fast as modern Pentium or PowerMac systems. My 100 MHz PowerMac runs integer-only 680x0 software (the FP instructions aren't emulated) faster than a 40 MHz 68040 can, through emulation! (And you wouldn't believe the speed difference between a 16 MHz 030 and a 40 MHz 040.)

Bleating about how wonderfully efficient GEM is and how small ST programs are won't change some other facts, either - like the fact that GEM and ST programs are woefully lacking in support for many major features needed by large numbers of users. Networking is a real big example.

And for all its efficiency in some areas, GEM's performance and design is often horrible in extremely silly little things. Like the stupid delay between the time you click the mouse button and the time when the system actually registers the click, and the fact that you can't move the mouse cursor off the button that you're trying to click during that time. You know why that happens? Because the original programmers of GEM were too stupid to check for double clicks via an intelligent method, and instead sit and wait until the double click timeout is over to actually get around to reporting the click. Great - the dialogs pop up on the screen real fast (if you have a screen accelerator installed), but an even more crucial element, responsiveness to very low-level user actions, is quite bad.

Don't even get me started on the use of the DOS file system, which is surely one of the dumbest ever invented. Or the interleaved bitmap screen layout, the world's stupidest way to format pixels in memory. I could go on and on...

: >at 700 Megs. They may know what they're talking about. :-)

: You seem to be using meaningless performance ratings here. 500 Megs per
: what? Second? Minute? What precisely do you mean by "Megs"?

While I was certain of the values (IDE=500, ACSI=700), I was uncertain
of the units, so I fudged and said "Megs". I followed that up with a
"correction" in which I claimed the units were "Kilobits per second",
which is also wrong (the ICD utilities show only "K/s" for units).

Actually, the units are kilobytes per second.

Sorry!

Methinks you have some problems with the number systems in which drive throughput are measured. For example, a typical 1.44 MB floppy drive is capable of 360 Kb/s (kilobits per second) burst. The numbers you're getting from ICD are probably in KB/s (kilobytes per second). The difference between a bit and a byte is quite significant. (BTW, your drive's a bit slow; I used to get about 1300 KB/s on my 1040STe, which was about the max the STe could do even though SCSI can go a lot faster than that.)

IDE is way, way faster than your dealer thinks it is. Even if the number he's giving you is actually 500 KB/s, he's full of it. Vanilla IDE is capable of at least 3 MB/s, and EIDE can attain 13 to 16 MB/s. (Your mileage, of course, will vary depending on the specific card and drive used.)

Here's my $0.02, for what it's worth:

The Mandelbrot benchmark was run by DEC to show off the power of their Alpha processor. So I would _guess_ that the benchmark would be somehow optimized for this processor.

Secondly, I think it was more or less intended as a joke by Atari to whip up a DSP mandelbrot generator and produce the pictures faster than DEC. I am sure they didn't want to state that the Falcon had more horsepower than a DEC. If I would be showing a computer with a DSP (the ultimate fractal processor!) and somebody else had their computer show off its fractal capabilities, I would do exactly the same as Atari did.

I don't recall any advertizing by Atari (ab)using these data. It's just a funny anecdote. Take it easy!

The great differnce is indeed the open architecture of the Falcon agaist
the closed archtecture of the Jaguar. One of the big costs for developping
the Falcon is the Operating System absent in the Jaguar.

Bob,
What I do on my Falcon is to install a JPEG viewer application under
GEM so that I can merely double-click on a JPEG to view it :-).
Very simple. Your method sounds simple as well although there is
more typing. If you have TOS 2.06 on your STe you should be able
to do this. I don't think 1.62 could.

>and is generally more of a pain in the butt to do so on PC. (decrunching JPEGs)

Oh, I dunno... all I do to decrunch JPEGs on my PC is type "J"...

How much of a pain in the butt is that..?

Of course, that's because I'm running a batch file named J.BAT (sorry, no batch files on a Falcon) which actually saves me the tremendous effort of typing in "DJPEG *.JPG".

ALL computers and operating systems have their good points, and their bad points... I find myself wishing my STe had some of the things I've come to take for granted on my PCs, and vice versa.

That doesn't make either of them better or worse.. only different.

You could configure your desktop in a way that you'd only have to
press, say, F1 to decrunch JPEGs. Even simpler... You won't even
have to press RETURN... :-)

>ALL computers and operating systems have their good points, and their bad
>points... I find myself wishing my STe had some of the things I've come to
>take for granted on my PCs, and vice versa.

Indeed. The one thing I like of PCs are the dirt cheap peripherals.
A 2M Video card for my Falcon costs about $540, the same 64bit
technology for PCs would only be about $150.

>That doesn't make either of them better or worse.. only different.

I suspect many Atari users just keep on using Ataris is because of
this. I'm one of them, and though everytime I walk into one of these
big computer stores it hurts to see the current Pentium prices. But I
won't give in!! I _don't_ want to have the same computer as
everybody else...

3199. Jag CD combo again

Newsgroup: comp.sys.atari.advocacy
Date: 1995-11-22 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.951122083840.11550A-100000@PEAK.ORG>
Source record: 10754

Well, after all this discussion and reading Mark Rathwell's post that the CD/combo unit has been discontinued, I was thumbing through a videogame magazine and read a little blurb about what's coming out for all the new systems.

It said that the Jaguar 2 is the combo unit, and that it's "real 64-bit" (don't mean to start that up again). According to the article, the Jag2 has 64-bits on one chip, not more than one. If it's different architecture like that, I wonder if it will be completely compatible? Anyway - it sounds good. I think it's great to be able to buy one (Jag) and the other (CD) seperately, but then software makers have a two-headed beast to feed - almost like two different markets to cater to. If something is *standard* equipment like a built-in CD, it will get total support. Look at the Sega CD for Genesis - and the 32X -now there are two expensive peripherals for the Genesis that are headed absolutely nowhere in the future with the Saturn in the spotlight!

Date: 1995-11-23 00:00:00 UTC
From: dferran@crash.cts.com
Message-ID: <492bqu$6a1@news2.cts.com>
Source record: 10758

Martin Thomas (martin@llanelli.demon.co.uk) spent some time and effort
to post the following :

: George Crissman - Ferran Scientific (dferran@crash.cts.com) wrote:
: : No, the 520 ST from 1985 is generally considered to have processing
: : power equivalent to a '386 running at 33 MHz. Good guess, however.

: Umm.. don't think that's correct. Well not according to the July 1987
: issue of BYTE which benchmarked the 80386 & 68020. I've summarized the
: results below. The Compaq Deskpro & MAC SE/Hypercharger ran the CPUs at
: 16mhz, FPUs at 8mhz. The standard SE was a 68000 clocked at 7.83mhz, no
: FPU, which would be closest to an ST in raw processing terms.

: TEST ITERATIONS DESKPRO SE/HYPER SE
: Fibonacci 100 3.10 71.60 264.00
: Float 10,000 5.41 4.16 229.98
: Sieve 100 5.98 14.94 64.70
: Sort 100 9.67 19.82 111.30
: Savage 25,000 35.10 8.78 1884.30
: Dhrystones/sec500,000 3703.70 2114.00 574.00

: As with all benchmarks, it's sometimes hard to tell what's being tested,
: the machine or the compiler.

True. However, those benchmarks do not include the system overhead
of Microsoft Windows (for the PClone) and GEM (for the ST). The
Microsoft product is so inefficient, that the 8 MHz 520 ST running
GEM feels like a '386 @ 33 MHz running Windows.

: : Regarding Falcon storage: generally speaking, a 10K "C" source file
: : will compile to approximately 5K of executable program on the Atari,
: : while the same source file will compile to about 20K on a PClone.

: This is surely compiler dependent and not processor dependent (maybe we
: should try comparing some compiler output? :-). I have the Zortech, MS,
: Turbo and GNU C/C++ compilers here and each produces executables of
: varying speed/size.

It is somewhat compiler dependent, slightly processor dependent (because
Motorola processors are more efficient), architecture dependent, and
compatibility dependent. The crazy-quilt of PClone "standards" dating
back to 1982 requires bloated code to ensure the software will run on
the greatest number of "compatibles".

: : This four-to-one ratio suggests that 4 Meg of Falcon RAM translates to
: : 16 Meg of PClone RAM, and 350 Meg of Falcon hard drive translates to a
: : 1.24 Gig hard drive on the PClone.

: I don't know how true your 4-1 ratio is, but data is the same size no
: matter what system you use, and if your into hard disk recording it's
: gonna take up a lot of hard disk.

If you were to fill the hard drive with executable programs, you would approach the 4-to-1 ratio. Since this is an unreasonable extreme (there must be data SOMEwhere!), I've been allowing PClones a more-reasonable 2-to-1 ratio for comparison purposes.

: > In a previous article I wrote, it is said that Japanese business practice
: > is stiffling U.S. penetration of the Japanese Video Game industry.
: > Is this, true ?

Yes. Now I don't usually believe in conspiracy theories, but the
fact that the magazines have been spreading so much misinformation about
the Jaguar is pretty suspicious. Japanese companies also make it their
general practice to do things by which American standards would be called
unethical (flooding the market, blocking American companies in Japan, etc.)

: > If this is true, why haven't magazines done a full spread on this topic ?

Because every other system (besides the Jaguar) is made by a Japanese
company. That's a LOT of advertising dollars.

> Are U.S. Video Gaming Magazines anti-Atari

See above :)
?
: > If so name specifics ... (my personal of course is EGM).

Yeah, probably the worse offender.

: > In general MOST AMERICAN magazines suffer from this. I believe it is due
: > to the kind of people these magazines employ (some articles make me
: > question the level of qualification/education of these
: > "reporters/writers"). These people are thus allowed to hold onto hier bias

Most video game magazine "writers" (and I use the term loosely) don't
seem to have any qualifications whatsoever. There are exceptions, of course,
but I buy magazines mainly for the advertisements.

: > I personally prefer reading British gaming mags, as they are more in depth
: > of reporting, and provide more factual content, rather than a pile of
: > hype, and trash reporting.
: > U.S. magazines I read ? Definately NextGen, and sometimes GamePro.
: > NOTE: I think this is genuine discussion topic, do not regard it as
: flame bait.

Well, you're probably going to get flamed anyway (so will I, probably:P).
The only system I own (the only system still being manufactured, that is) is
the Jaguar. However, I feel no need to flame the other systems (or their
owners). Honestly, hardware-wise there are no bad systems (not something
that's been true in console history) out, and the fact that most of these
magazines for some mind-boggling reason take sides is ridiculous. Where
do they recruit the writers? Junior high schools across the country?

DTP: it's called the "Apple PowerMac x500" with "MagiCMac" and "NVDI for Mac".
Calamus users are Calamus users, not Atari users. And MagiCMac also runs
word processors, spreadsheets, databases, etc..

Multimedia and video production are not very strong on the ST line, with
the exception of special Falcon software.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,z-netz.rechner.atari.hardware,zer.z-netz.rechner.atari.hardware,zer.z-netz.rechner.atari.programmieren,z-netz.rechner.atari.programmieren

WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

Nov 23, 1995 - 1.3

---
1. INTRODUCTION

TECNATION DIGITAL WORLD, the creators of the BiT BOPPER Dynamic Graphics
from Audio software for the Atari / C-Lab Falcon are seeking a 3rd party
company to take over the development and marketing of this innovative
product.

The software is at release 1.51, which is stable and had been well
received by our initial customers.

If you're on the web, surf to:
http://www.tecnation.com
and choose CHANNEL 14

---
2. YOU

If you think you can take on BiT BOPPER and continue to DEVELOP it, and
MARKET it world-wide on the Atari / C-Lab Falcon, we would like to hear
from you.

Requirements:

- You must be competent
- Previous experience with the Falcon
- Previous experience with the markets BiT BOPPER is targeted towards
- You must have the financial resources to further develop and promote BiT
BOPPER world-wide
- You must have the ability to create high quality marketing material to
backup the innovative and eye-catching nature of BiT BOPPER
- You must have a world-wide web site, or you may use our site to promote
BiT BOPPER until you get your own. (The URL for ours is shown later in
this document.)

---
3. QUESTIONS AND ANSWERS

- Why is Tecnation looking to pass on BiT BOPPER?
We are now too busy with other ventures, but firmly believe the market for

BiT BOPPER is ready for exploitation - which is why we are keen to keep
the product alive!

- What are the financial details?
We will require an advance payment, followed by royalties. All negotiable.

- What will you receive as part of the deal?
We will provide our development system, and all source code, documentation
and user documentation.

- What technical support will Tecnation provide?
We will provide some up front technical support to help with any transition.

- What about Mac and PC versions of BiT BOPPER?
This is negotiable.

- What specification Falcon does BiT BOPPER require?
4Meg of RAM and at least 10Meg of hard disk space. Audio input. MIDI IN.

- How many Falcons are their in the world?
Unsure. However, now C-Lab are building them, the installed base will grow.

- Does it matter where you are based?
No! Although we would prefer a German company due to the popularity of the
Falcon in Germany, we welcome anyone from anywhere.

- Was BiT BOPPER sold under a different name before?
Yes. Falcon BiT BOPPER was previously sold as SONOVISTA, but not any more.
It is known as VIBRAVISION in Germany, however, we ask the name BiT BOPPER
is used globally to simplify matters.

---
4. FOR MORE INFORMATION ON FALCON BiT BOPPER

Use your web browser and surf to:

>faster than the Alpha when running this benchmark.

It wasn't a benchmark. In a benchmark, the code is standard so that the differences in performance can be attributed to the hardware only. (Yes, compilers can affect the results, but that's another story.) The point here is that there was no standardisation. DEC wrote a program. Atari wrote a program that did the same thing. Atari's program ran faster. What does that prove? Nothing. We have no way of knowing whether the Atari ran the program faster because the hardware is better, or because the algorithm was better.

> and many other factors.

"Harvard Architecture" is _A_GOOD_THING_ as any first year computer
science student will tell you.

In Harvard architecture, code and data areas are kept separate, even
though they are in contiguous memory locations.

This allows the use of one bus interface to load instructions to be
executed, and another bus interface to load data. Both code and adata
buses can operate independently of one another. And both can operate
simultaneously.

The Motorola 68030 is a good example of such an architecture.

The Intel 16- and 32-bit protected mode architecture (80286, 80386, 80486,
Pentium, Pentium Pro), theoretically allow for this, but the system
implementations I have seen do not seem to be intelligent enough to
exploit it.

The register starvation of the intel architecture does not allow for
common big-iron programs to run efficiently on such architecture.

: Where?

Write to Atari and ask. I don't live in Iowa.

: Quit making excuses for Atari.

Who's making excuses? If Atari was ready to ship to Walmart, but
the Walmart execs wanted to review the deal then I see no reason why
Atari should be blamed. Word has it that Atari has begun shipping to them
finally.

Does Atari have enough inventory to supply
: Wal-Mart stores?

I'm not in charge of the production of the Jaguar and I doubt
that anyone knows how much inventory Atari has.

PISCHKE DAVID (pischke@ecf.toronto.edu) wrote:
: In a benchmark, the code is standard so that the
: differences in performance can be attributed to the hardware only.

No, but close. The method used to perform the benchmark is
standard. If you were comparing different versions of the
same computer system (say a '386 vs a '486 vs a '586), your
method would be correct. However, you cannot run a program
on a Mac that was written for a PClone and vice versa (assuming
you're not using an emulator of some sort, which would add it's
own inefficiencies if used). The program won't run on another
system because the architecture of the other system is different,
the op codes are different, and the operating system is different.

Using "standard code" also makes it impossible to include the added
computing power of, say, a Digital Signal Processor, unless
that feature is available in all of the computer systems tested.
Standard code would give inaccurate results in this situation, since
not all of the computers tested contain all of the standard Falcon
hardware features. For the most accurate results, the benchmark
must be custom-written using the standard method for each machine
it's to be used on.

: DEC wrote a program. Atari wrote a program that did the same thing.
: Atari's program ran faster. What does that prove?

In the case of this one benchmark, it proves that the Falcon is
slightly faster than the Alpha that was being demonstrated. Your
comment that these programs "...did the same thing..." makes it
pretty clear that it's reasonable to compare the results between
the various incompatible systems.

I have 16 megs and my set up still costs way less than the four meg Falcon.
Considering that the Mac OS and apps have more features and functionality than
the zero Atari equevelant ones..

I agree that having the two distinct platforms has it's problems
. . .

> something is *standard* equipment like a built-in CD, it will get total
> support. Look at the Sega CD for Genesis - and the 32X -now there are
> two expensive peripherals for the Genesis that are headed absolutely
> nowhere in the future with the Saturn in the spotlight!

. . . but I don't agree that CD-ROM is the way to go. I much
prefer cartridge-based games, because of the speed of access. Videogame
units offer only double-speed CD-ROM, which isn't even close to being as
fast as a cart. True, they're far cheaper to produce, which is nice for
the publishing houses. But the consumer doesn't win there - CD-ROM's
cost the same as carts do, at the retail level. Sure, you can get
full-motion video (or something close to it), but I have yet to see a
CD-ROM game that uses FMV in such a way that it enhances playability. At
this point, with these access speeds, it falls under the "bells and
whistles" category.
So, I'm happy with the way Atari handled that aspect of the
Jaguar.

Source record: 10775

>The benchmark program must be written especially for the machine
>... or the testing will be inaccurate.

Er.. no..

(Look up "benchmarking" in Computer 101 text books)

The purpose of running a benchmark is to run a STANDARDIZED program on
dissimilar hardware to gain a appreciation of the relative efficiency
with which the DIFFERENT hardware runs the SAME program.

It's similar to running different cars on a Dynomometer under a STANDARDIZED
set of conditions to determine how the different vehicles perform under
SIMILAR conditions.

Optimizing a PROGRAM to make a computer perform better than another may be
good PR, but it's NOT "benchmarking".

BobR

Source record: 10776

>True. However those benchmarks do not include the system overhead
>of MicroSoft Windows (for the PClone) and GEM (for the ST).

That's right... that's why they are called "benchmarks".

They test the relative performance of the CPUs, as was the intention.

>The MicroSoft product is so inefficient, that the 8 Mhz 520 ST running
>GEM feels like a '386 @ 33 Mhz running Windows.

It's precisely this kind of SUBJECTIVE assessment that "benchmarks" are
designed to avoid.

It has also already been explained that there are OTHER reasons for perceived
differences in operating speed than "inefficiencies", including the fact that
GEM on the ST is only updating 32K of screen RAM, while the typical Windows
screen has to update more like 614K of screen RAM, a difference of almost
20 times.

This fact has been conveniently ignored.

I seriously doubt ANYONE would try to say an ST "appears" to run almost 20
times faster than a Windows system, so based on this "benchmark", you'd
have to say that the Windows system is MORE efficient than the ST.. right..?

Sorry... biased opinions and benchmarks do not mix.

>the op codes are different, and the operating system is different.

That's why you write the code in a high-level language and use as few
operating system calls as possible. (If you are testing only raw processor
performance, that is, and are trying to eliminate any variations cause by
software.)

Tell me, why can't I run this program written on a PC on some other machine?

```
main{}
{
printf("Starting\n");
/* some mathematical calculation here */
printf("Done\n");
}
```

>Using "standard code" also makes it impossible to include the added
>computing power of, say, a Digital Signal Processor, unless
>that feature is available in all of the computer systems tested.

If you're trying to measure the holisitic performance of the machine, then
you'd better include stuff which doesn't depend on the DSP. That's another
story, though. The point is that it's OK to use the DSP, as long as we can
be sure that the algorithm used is the same as the other machines. Of
course, the result will still be misleading -- it will only tell you about
the speed of the DSP, not the speed of the CPU, which has a much greater
impact on system performance.

>: DEC wrote a program. Atari wrote a program that did the same thing.

>
>In the case of this one benchmark, it proves that the Falcon is

>slightly faster than the Alpha that was being demonstrated. Your
>comment that these programs "...did the same thing..." makes it
>pretty clear that it's reasonable to compare the results between
>the various incompatible systems.

Did you even understand that thought experiment I talked about a few weeks ago? The point is that we don't know if the algorithms used in the two programs are the same, so we have no way of knowing that the results for the Falcon indicate that the Falcon is faster *SIMPLY BECAUSE IT USED A MORE EFFICIENT ALGORITHM*.

Let me compare two machines that are exactly identical in every way, except that one uses a processor at 8MHz and the other uses a processor at 32MHz, and try to do a benchmark that compares the time it takes to search through a sorted list of 1 000 000 names. On the 32MHz machine I search through the list linearly. On the 8MHz machine I do a binary search. As I proved in that thought experiment, the 8MHz machine will complete the search much, much faster than the 32MHz machine.

Clearly, this test is invalid. Why? Because THE SAME PROGRAM WAS NOT BEING TESTED. THE DIFFERENCES IN EXECUTION TIME WERE DUE TO THE DIFFERENT ALGORITHMS, AND NOT DUE TO DIFFERENCES IN THE PROCESSOR.

Well my home machines run just NT & Linux. BTW, Linux is not difficult to
install, PC owners who have messed around with autoexec.bat's & config.sys
will find themselves at home :-).

Martin.

We've got an 800XL system we're looking to get rid of. Included with the system:

1050 disk drive
CX77 Touch Tablet
1020 plotter
410 tape drive
several disks/software
several books/magazines -- manuals,etc.

We're thinking maybe $100 for all. For more info or to make an offer, please write Joe at JFabregas@aol.com or respond to my message. Thank you.

Pete

>Hell, all I do is drag the .JPG file to SPEED OF LIGHT that is installed
>on my desktop.

I could do that too, under Windows or OS/2.. it's just easier for me to simply press "J" (for JPG) than to open a directory window, scroll down to find the file, then drag it to the viewer... (as you'd have to do on a Falcon as well).

The point is, "user friendly" is a subjective term. If you'd rather go through all that on a Falcon than simply press "J", then that's fine... maybe it's more "user friendly" for you. Everyone's different...

: Intel 4004's, or PowerPC's for all I care -- the processor type was
: irrelevant. The entire point of the thought experiment, which you didn't
: respond to, and apparently didn't read, was that a variation in the
: algorithm used on one machine's test from the machine used on the other
: machine's test can produce the result that a 32MHz machine is slower than
: the same machine at 8MHz! There was nothing in there that was beyond first-
: year computer science. This thought experiment clearly showed how invalid
: the DEC Alpha Mandelbrot "benchmark" is.

I'm always cautious around thought experiments, because there are
unstated suppositions that affect the outcome.

In discussing the "variation in the algorithm" above, I believe that
you're stating that the performance of the benchmark is directly
related to the skill of the programmer. This is true, and I agree
with you if this is what you're saying.

As a real world example of the "skill of the programmer" affecting
the outcome of software development: I was visiting some friends at
another company one day, and discovered they were in a panic. It was
necessary for them to implement a nibble-to-ascii function on an
Intel MCS-51, and the system PROM was so full they had less than
50 bytes to do the whole thing. The smallest code size they could
achieve for the patch using their methods exceeded 200 bytes, leaving
them with a very expensive hardware redesign to get the job done.

I suggested they put one nibble in the accumulator, perform a
Decimal Adjust Accumulator (normally used in BCD math operations),
then add an ASCII '0' if the carry was a zero or add an ASCII 'A'
if the carry was a one, then send the result out to the UART. It
was simple, easy, and fit the PROM space available. The only problem
is that it was "clever", which is major violation of standard
programming discipline.

After much discussion of the technique with the rest of the team
(some of it involving Roman Numerals, for reasons that still aren't
clear :-) and careful examination of various data books, they
implemented the technique and tested it. It worked just fine.

Although execution speed wasn't the primary issue here, it *does* illustrate the importance of the "skill of the programmer" to get the best performance out of a system.

That's why, when comparing dissimilar systems, it's necessary to have a programmer that is aware of the system details custom-write the benchmark for each machine to make best use of the features available. Only in this way can the full power of each system be compared.

After all of the commotion over this, and all of the people who know more about benchmarks than you and I (and who have more common sense than you) you still call this a "benchmark" and that the "Falcon is faster than a DEC Alpha." THAT IS THE BIGGEST LIE/ASSUMPTION I've ever seen on any computer-related newsgroup, and you earn an honorary dunce cap for such drivel. Let's drop it now.

I don't know where you got that 20%. However, all I can vouch for is that in the Toad Catalog, very few titles are advertised as "Falcon compatible." Sorry, I can't argue with a printed page or a signpost as you may.

>
> 2. That Toad Computers is dumping non-working software and

> experience with Toad has been exceptionally positive!).

You are totally unbelieveable. My point was that if 80% of the games run on the Falcon, then 80% of the games that Toad sells should be marked "Falcon compatible" when in fact it's a minority of games that they have advertised as indeed "tested with Falcon." It seems pretty straightforeward and reasonable. As far as "dumping non-working software" - that is your assumption that I said that. I never said that they intentionally engage in deceptive sales practices - more Crissman hogwash. If they run on the Falcon, they should be advertised as Falcon compatible. If they don't, then they shouldn't. If a place sells software that is "supposedly" Falcon-compatible and they sell Falcons, yet some of the software says for sure it is compatible and others don't say, then there shouldn't be any ambiguity or guesswork. Titles should be tested. That's all I have to say on the matter and I won't comment further.

No - to insure it runs on the greatest number of clones, it's written to
run on an old 8086. The bloated code is because the programmers get lazy
since they think they have such a fast machine to work with - unlike the

days when we all ran 6502s at less than 2mHz.

Please tell me what assumptions or suppositions I made that invalidate the outcome. The entire point was that unless we can be sure that both machines used the same algorithm, we can't be sure that the differences in execution time are because of the hardware and not differences in algorithms.

>Although execution speed wasn't the primary issue here, it *does*
>illustrate the importance of the "skill of the programmer" to get
>the best performance out of a system.

The point is not relevant to this discussion. If we want to make a comparison between two machines, we have to use *the same algorithm.* It has nothing to do with "special features." If I implement a search benchmark on machine A, I must use the same search algorithm on machine B. It's the same principle as with scientific experiments -- control all variables except the one you want to examine.

>That's why, when comparing dissimilar systems, it's necessary to
>have a programmer that is aware of the system details custom-write
>the benchmark for each machine to make best use of the features
>available. Only in this way can the full power of each system be
>compared.

You missed the point entirely. We have no idea if the program Atari ran on the Falcon was the same algorithm or something totally different. A more efficient algorithm on the Falcon will make the Falcon appear faster! It has nothing to do with special features. That's why the 32MHz machine in the thought experiment appeared slower than the 8MHz machine -- because the differences in execution time are due to the MORE EFFICIENT ALGORITHM, not the differences in hardware. I feel like this is becoming my new mantra.

Why's Atari even an issue? C-LAB and GE Soft are the primary makers of
TOS machines. Atari's computer people left years ago anyway!

>I don't know where you got that 20%. However, all I can vouch for is
>that in the Toad Catalog, very few titles are advertised as "Falcon
>compatible." Sorry, I can't argue with a printed page or a signpost as

Read the small print - it says that these are programs that Toad has tested and found to be compatible with a Falcon. It is incorrect to assume that unmarked software titles don't work (most do, especially when one uses a utility like Backwards). A more reliable source of information would be one of the man compatibility lists circulating in online magazines and FTP sites.

>I think the biggest lie/assumption is your "Falcon faster than DEC
>Alpha" arguement. Period.

Again, the DEC Alpha is a microprocessor, the Falcon is a computer architecture.The comparison is flawed to begin with (and it was never stated by the
original poster that the Falcon was faster in all areas, simply that it demonstrated higher speed in this particular area).

If I take the tires off a Pontiac Firebird, and place it next to a Honda Civic with tires, who would win the race? The Civic, of course. Had Honda performed this test and advertised that a Civic beat a Firebird in a race, it would be unethical. If, however, Pontiac hadtaken the tires off the Firebird in a demo, and because of this, the Civic won, whose fault would it be that the Civic "outperformed" the Firebird?

Suffice to say, DEC is Pontiac (for the sake of this comparison), and Atari was Honda. DEC presumptuously tried to infer that a system was superior due to its ability to process this sort of algorithm. Some of the fun-lovers who worked at Atari back then decided to put egg on DEC's face. Very simple. Very straightforward. It doesn't require insults or high blood pressure to register.

James Wood <jamesw@PEAK.ORG> writes:

>Second, to answer your question - it's because you're a pompous ass.

It's been said that the first person to insult another in an argument has lost the argument, regardless of how "valid" his or her points are. How "pompous" that is is up to question. . . Whether or not you are correct is immaterial since you have lost any debate with me already by tossing out the insult.

>Third, you need to learn something about the thread before you ignorantly
>butt-in and blow-hard. If you want to call someone an intellectual void,

Know what about the thread? As a frequent reader of these conferences, I am aware of the entire debate, including your mischaraterizations of people's arguments. The argument was primarily degenerating into a series of insults (which you started first). In order to bring the absurdity of your remarks to light, I posted the message (and received the reply utterly free of substance that I anticipated).

>CLAIMING THAT HIS FALCON IS FASTER THAN A DEC ALPHA. If you don't know
>what I'm talkig about, then I suggest you refrain from posting on threads
>of which you don't understand the arising circumstances.

When was this statement used? I believe the argument was not over whether a Falcon was "faster" generally than a DEC Alpha (again, a MICROPROCESSOR, not a computer, so the argument is invalid), but over whether a benchmark conducted by Atari was valid for stating that in certain *limited* areas, the Falcon has an edge over a DEC Alpha-equipped computer. Your attempt to mischaracterize the argument, place words in someone else's mouth, and insult earned you the negative accolades you received from folks like Steve Tirrell (sp).

Also, even if you were correct in saying that this person claimed a Falcon was faster than an Alpha, in the interest of debate, why even waste your time? Noone with any iota of knowledge (especially someone who knows an Alpha is a chip, while a Falcon is a computer architecture) and limited time would waste said time on such a foolish argument.

: >system because the architecture of the other system is different,
: >the op codes are different, and the operating system is different.

: That's why you write the code in a high-level language and use as few
: operating system calls as possible. (If you are testing only raw processor
: performance, that is, and are trying to eliminate any variations cause by
: software.)

But when you use a compiler, you're automatically delegating all
your programming decisions to another group of people* who had to
decide on the tradeoffs between code size and execution speed,
the need for portability, and the defensive programming necessary
to ensure the compiled code has the greatest liklihood of running
properly. Since they cannot know you'll be using their product
for benchmark testing, it's a good bet that the final product won't
give you the best possible performance.

* (i.e., the people who wrote the compiler.)

: Tell me, why can't I run this program written on a PC on some other machine?

: main{}
: {
: printf("Starting\n");
: /* some mathematical calculation here */
: printf("Done\n");
: }

Once it's compiled into native code for the target machine, it
should run just fine (assuming all the normal #includes, etc.).
Even if you can find C compilers for each of the target machines
from the same company (Lattice springs to mind as a broad-line

supplier), there is no guarantee that each implementation of the compiler will make the best use of each computer's architectural features for benchmarking purposes.

Even relatively low level languages such as C introduce their own inefficiences to the final executable program, which probably varies from machine to machine. For a truly accurate indication of system power, writing the benchmark in assembler (customized for each target machine) is the way to go.

: >Using "standard code" also makes it impossible to include the added
: >computing power of, say, a Digital Signal Processor, unless
: >that feature is available in all of the computer systems tested.

: If you're trying to measure the holistic performance of the machine, then
: you'd better include stuff which doesn't depend on the DSP. That's another
: story, though. The point is that it's OK to use the DSP, as long as we can
: be sure that the algorithm used is the same as the other machines. Of
: course, the result will still be misleading -- it will only tell you about
: the speed of the DSP, not the speed of the CPU, which has a much greater
: impact on system performance.

In the case of the Falcon, the DSP is clocked at 32 MHz while the CPU runs at 16 MHz. Since the DSP can perform two moves, a 24-bit multiply, and an accumulate in a single operation using it's own private program and data RAM space, it is clearly the powerhouse during math-intensive operations and can have a *significant* effect on system performance. I would assume that the CPU would be mostly an event manager in such a situation, doling out tasks to the DSP, the blitter, and/or the 68882 math coprocessor (if installed).

The general-purpose DSP is a standard feature included in all Falcons. It is a part of the computer, and may properly be included in benchmark testing of system performance. To the extent that you are testing CPU performance only, you are correct that using the DSP will provide misleading results. But for system comparisons, the DSP must be included in the test for an accurate determination of system power.

Yep, I was wrong on that count. I didn't suspect that Sega would bail out Atari. But, Atari is not a factor in the market anyways. The Sega money is drying up and Atari has no chance of ever recouping all that money that went into the Jag.

Harvard architectures are generally faster than other memory systems, actually, because they sidestep the instruction/data memory bandwidth problem. Simply put, if your instruction memory and data memory are the same, there is contention for access to that unified memory. Harvard architectures use separate memory buses for instructions and data to improve speed.

Intel x86 processors don't use a Harvard architecture, either. (The internal processor cache might be Harvard-ized on the 486 or later, but the main memory bus is unified.)

I don't quite know how to put it, but you are just plain, flat-out, *wrong*! Not because it's bad to take advantage of special hardware. That's great, that's OK. Many valid benchmarks can be constructed where one machine uses its special capabilities and the other has no comparable capabilities (I'll go more into that later). You're wrong because, in this case, the special capability in question does not require any kind of fundamental change in the algorithm used.

A DSP is more or less like an ordinary CPU, but optimized for certain kinds of math operations (the core DSP operation is to multiply two numbers and add a third number to that result very quickly). Its design philosophy sacrifices general purpose performance to get large benefits on a limited range of programs. This is typically done by using lots of hardware on the multiply-add instruction, and using a memory bus that goes overboard in bandwidth. Neither of these things really make a big difference in how you program a DSP compared to a CPU.

Because of that, a DSP does not need algorithmic tweaks to get benefits from running things on the DSP instead of the CPU. You simply recompile with the DSP as the target, or translate the machine code without changing the algorithm. If you change the algorithm, that change almost always gives benefits on the ordinary CPU as well.

Mandelbrot set calculations are fairly well suited to DSPs. In them, the equation z=z^2+c (where z and c are complex numbers) is iterated many times on each pixel to determine whether the pixel is in or out of the set. This equation is easily broken into a few multiply-add operations, which DSPs excel at. Algorithmic improvements to the Mandelbrot set calculation always involve things not related to this fundamental operation, and apply equally well across processors.

Therefore, to have a valid comparison between the DEC Alpha and the Falcon with the Falcon using the DSP, the source code used in the DEC benchmark *must* be used for the Falcon. There is no reasonable way I know of to argue that a DSP must use algorithmic changes to perform well when calculating the Mandelbrot set. The only changes I would consider justified are those needed to get it running. You have to separate the actual Mandelbrot routine from the rest of the program, add small amounts of code to handle shipping finished pixels to the 68030 (no algorithmic changes to the actual Mandelbrot code are needed), compile it for the DSP, and make a shell that runs on the 030 to display the results and track how long things take.

What do you do when algorithmic changes really are needed to take advantage of hardware?

Often this means that a piece of hardware was designed to entirely replace a software subroutine. A common example: accelerated graphics cards. In this case, the card completely takes over functions normally handled by the OS, like line draws, blits, text drawing, and even more. To get around this problem, you consider each call a fundamental unit to be benchmarked. For example, one benchmark might report that System X with just software does 50,000 TextRenders per second, while the same System X with the Ronco MiracleText2000 card does 2,000,000 identical TextRenders per second.

Such comparisons can break down easily, and when they do, what you end up with is an application benchmark, not a low-level performance benchmark. Sometimes you're comparing application A against app B (on the same or different hardware). Other times you're comparing A on one platform to A on a different platform, and anything goes in terms of optimizing A for each platform. In such a test you can't make a general statement about the performance of the two machines; you can only conclude that one is faster than the other when each runs its version of the same program. A good example: the latest versions of the programs in the Microsoft Office suite run much faster on PC clones than they do on comparable Macintoshes, because Microsoft did the Mac ports very poorly. That doesn't make the Macs slow, it just means that if you want to run Office, you're probably better off with a PC.

Several times you have strongly implied (maybe even explicitly stated) that the Falcon is faster than a DEC Alpha and almost any Mac or PC, and you have repeatedly used this so-called benchmark as support for the idea. I hope that idea is now firmly laid to rest in your mind. If not, please explain. To the best of my knowledge, the whole incident proved just one thing: Mandelbrot Program A on the Atari Falcon ran faster than Mandelbrot Program D on a DEC Alpha system. There is a world of difference between that and a conclusion that the Falcon is "faster." You can't even say that the Falcon is generally faster at computing the Mandelbrot set, because no common code was used. There are too many variables to draw good conclusions about the relative performance of the two machines.

: You missed the point entirely. We have no idea if the program Atari
: ran on the Falcon was the same algorithm or something totally different.

Since all systems were running a Mandelbrot benchmark, the algorithms
are at least "similar", if not exactly identical. The difference is
in the implementation of the coding as it uses the hardware to perform
the task.

: A more efficient algorithm on the Falcon will make the Falcon appear
: faster! It has nothing to do with special features. That's why the
: 32MHz machine in the thought experiment appeared slower than the 8MHz
: machine -- because the differences in execution time are due to the
: MORE EFFICIENT ALGORITHM, not the differences in hardware.

That's why, when comparing dissimilar systems, it's necessary to
have a programmer that is aware of the system details custom-write
the benchmark for each machine to make best use of the features
available. Only in this way can the full power of each system be
compared.

: I feel like this is becoming my new mantra.

Join the club!

You need more than four megs on the Falcon..Lets be realistic.
My 16 megs ram - 8 megs real plus Ram doubler = 16 megs ram is sufficient for
my needs. My set up costs way less than the Falcon being advertised from Toad.

Dream on. Most PC companies are having problems satisfying demand. How is Mac
owners being reduced when Apple had a 25% gain in Mac unit sales in Q3 and
expected 50% gain in unit sales in Q4.

I certainly doubt that Atari will soon drop the Jaguar, as they
have an infomercial selling the Jaguar. You know things at Atari
are grim when they have to stoop to that marketing ploy. YIPES!

Nope. And even if the algorithms are similar then there are still some
benchmarking issues that need to be dealt with. What sizes of floats
were used (if floats and not fixed were used)? What sizes were the
loop counters? What was the accuracy of the math libraries that were
used? <= this is a big one. if you know how much precision you will need
then you can write routines that only give that much precision. I
suspect that DEC was using "Math.h" for itself and the PC and SANE for
the Mac. The Falcon was probably using "good enough" math routines.

Yes, swapping is done by the VMM when a program accesses parts of the RAM
that are in fact on the hard disk drive. Then, a page from RAM is saved to
the disk and the page on the disk is moved to RAM, this process is called
swapping.

ROTFLBTCSTR

Ram "doublers" are only available on the Mac becaus MacOS has horrible
memory management, it is a _memory_hog_, as stated above. In fact, SoftRAM
(for MS-Windork) has been proven to be placebo software, and I doubt any
of the other programs is that much better.

Yes, I'm sure you think you know everything that's going on. However,
spare me your opinions because they mean nothing to me. By the way, how
about some hard examples of this alleged "mischaracterization?"

> The argument was primarily degenerating into a series
> of insults (which you started first).

I apologize to Scott Tirrell - I jumped in and called him names first.
He's actually been a nice guy and I'm sorry. However, Thorston Guenther
was calling me "dumb" first and even you (in a bout of hypocricy) jumped
in saying something like "I'm replacing Sinclair" in a derogatory
statement about me. I really don't care what either of you think; the
point is that I wasn't the first - exception to Mr. Tirrell. I wouldn't
expect you to apologize for your poignant name-calling, because you
wouldn't be a hypocrite if you did.

> In order to bring the absurdity of
> your remarks to light, I posted the message (and received the reply
> utterly free of substance that I anticipated).

You shouldn't undertake such endeavors that you are clearly incapable
of. There was *no* substance (and only name-calling criticism) in your
post. You act like you should get a nobel prize. Sorry.

>

> Steve Tirrell (sp).

It's pretty damned obvious that the Alpha was installed in a computer for
the comparison. Do you have any other brilliant insights that you'd like
to share with us? I don't have time to quibble over such simplistic
arguements as whether or not it was a Alpha chip of Alpha-eqipped
computer. You must have lots of spare time on your hands an very little
substance to argue if you're going to reduce it to that. The point was
that George Crissman has repeately posted OVER AND OVER what he believes
to be a "benchmark" that demonstrates the Falcon is faster than the Alpha
computer. Myself, David Pishke, Tim Seufert and others have taken issue
with that belief. THAT'S THE ISSUE - now damnit comment on that issue
and quit trying to muddy the water in an attempt to smear me. No doubt
you're willing to take things to any extent (at this point) to try and
save face, but please - take a stance on the Falcon vs. Alpha arguement
that is paramount to this entire situation if you want part of it.
Otherwise, take it to email with me and I'll either ignore you or give
you a good mud-slinging if that's what you want.

>
> Also, even if you were correct in saying that this person claimed a Falcon
> was faster than an Alpha, in the interest of debate, why even waste your time?
> Noone with any iota of knowledge (especially someone who knows an Alpha is

> waste said time on such a foolish argument.

That arguement makes more sense than yours in this message. What I see
in you is someone who feels threatened because of a hypocritical
name-calling post and is now resorting to several K-bytes of ascii
diatribe that's off-subject as a last-resort attempt to save face. Take
it to email. You call the whole thing foolish, but I keep seeing posts
from you. Perhaps it is foolish after all, then.

James

Heh. I remember hearing the same, except as I understood it, the majority of the stock was Atari's "E.T." cartridge for which it paid so many MILLIONS for the rights of, yet flopped terribly in the marketplace. They probably couldn't have done anything more with the carts!

I seem to remember Commodore airing a number of infomercials for the CD-32 shortly before they went under. . . I think this is another example of Atari's business plan. Start out with the hottest, best, fastest hardware on the market, price it cheaply, make no real effort to market it or encourage developers to develop for it, refuse to pay for shelf space (Atari doesn't pay that much for shelf space as opposed to competitors, which is why their stuff is always in the corner instead of up front), wait until competitors pass you by technologically, drop the product, go with something new, repeat cycle.

The only employees that really endeared the userbase to the company when it was still making computers were engineers like Shiraz Shivji, Alan Pratt, Richard Miller, Bill Rehbock, and John Townsend (all now departed), and Bob Brodie, marketing manager, also departed.

I think that Atari has shot its foot off by abandoning computers - before, loyal users would always buy the next Atari product, and keep it afloat (and in the $100 million + sales range). However, not many ST users are buying Jaguars - I'd bet more are buying C-LAB Falcon MK I's.

A shame, really - I used to believe in Atari.

"How valid are benchmarks, anyway?"

Exactly this debate has raged over the last few weeks in the intel
newsgroups.

Intel recompiled their SPEC95 benchmarks for the Pentium Pro (aka P6)
using their Reference Compiler (a highly-touted, and, I believe, _very_
expensive C compiler for the x86 chip) and got a 23% improvement.

Both sides in the argument waged war over if the 23% improvement was
"true" or simply faked due to the near zero-availability of the Reference
Compiler.

The only way to truly compare benchmarks is to change just one item.
Cross platform benchmarks are just plain stupid due to the million and
one differences between the items being compared.

An Intel x86 system would likely only have the RAM SIMMs and perhaps
diskette drives in common with a 68k system.

If one was to uproot the x86 processor and plug in a different x86
processor, then the benchmarks can be believed. Plugging in a 68k (with
an x86 personality module) might also be believable.

Note that "RAM Doubler" for the Mac is actually just a more intelligent version of VM that replaces Apple's horrible VM. (It's got to be one of the worst implementations of VM ever invented.) RAM Doubler uses several strategies to make disk access as rare as possible, including the compression of seldom-accessed pages (it's quicker to compress or decompress than it is to swap with the disk). Unlike Apple's VM, RAM Doubler uses a variable-size swapfile, and always sets the apparent virtual memory size to twice the physical memory. (Some people have written patchers to change the multiplier, so that RAM Doubler becomes a tripler or quadrupler, or even higher.)

There is another memory enhancer for the Mac, OptiMem RAM Charger. It does not give you extra virtual RAM. Instead, it gets around the Mac's ancient static application memory allocation scheme, so you get more out of your RAM. Normally, Mac apps get a fixed amount of RAM when they start, and can't get any more. If an app needs to do dynamic allocation, it can only dynamically allocate memory within its own heap. The size of the app's heap can be set by doing a Get Info in the Finder and changing the values shown. With RAM Charger installed, app heaps more or less disappear - it grafts true dynamic allocation into the system. It can retain conventional heaps for programs that don't work well with its enhancements, while still doing its job for all other programs running at the same time.

Both Doubler and Charger will be made completely obsolete by Copland.

The Windows RAM doublers actually do accomplish more than a placebo effect, though they're misleadingly named - they don't really double anything. (The specific program you name might be a scam, though - I haven't heard about it.) Most of them are basically fixes for the Windows 3.x resource bugs. Win3.x maintains a 64K block of resource memory that contains window and other GUI data structures. Unfortunately, the code that manages this memory is buggy as hell, and contains numerous memory leaks. So if you just open and close a program several times, the 64K resource block will slowly fill, because Windows fails to properly deallocate things. You can also kill it by trying to run too many programs at once, particularly if they hog lots of resource memory (Microsoft Office programs are common culprits). When the resource memory

fills up, Windows typically croaks over and dies - Microsoft, being Microsoft, didn't try to put in code to gracefully handle running out.

Anyway, the WIndows RAM doubler products try to get around that problem. Some of them do it very crudely - they just force 128K of resource memory to be allocated instead of 64K, or some such thing. Others try to patch Windows so it handles the resource memory better.

>Mac Quadra, the '486@66MHz, and the DEC Alpha."

I still have a problem with this statement. Calling what happened a benchmark is just not accurate. In a benchmark test, some effort is expended to make sure that all variables but one are as controlled as possible. In this case, no such effort was made. It is an invalid test, and should not be called a benchmark.

You could call it an applications test - Atari's Mandelbrot program vs. DEC's. But in that case, it is misleading to say that "the Falcon was faster", because whether you intend to or not, it implies that the Falcon hardware is absolutely faster than DEC Alpha, Quadra, etc.

After all, think about what would happen if you tossed a low-end PC running Fractint into the fray. Fractint is bloody fast, because they use extremely aggressive techniques to optimize Mandelbrot calculation. It doesn't even matter if the PC it runs on has a FPU. A low end 386 is probably sufficient to beat all the other times. Would that make you ever conclude, in any way, that the 386 was faster than the 486 used in DEC's test?

Actually, RAM Doubler will try to compressed unused RAM which sets it apart
from a mere VM scheme. This will minimize swaps and speed things up.
Connetrix has also stated that they have plans for a Copland version
of RAM Doubler.

You can use the colour of the computers case as "a reference point
serving as a standard for comparing or judging other things". But it
wouldn't tell you anything just like this Mandelbrot comparison doesn't
tell you anything.

>You're a hypocrite too....trying to preach such tripe after you jumped in
>calling me names because I said something you disagreed with.

You said nothing I inherently disagreed with - you did engage in continuous obscenity directed at someone who disagrees with you. Regardless of who is correct or incorrect in the debate, you lost your "ethos" or ethical ground (as well as credibility) by engaging in obscene insults. My commentary simply reflected the absurdity of this by quoting about five obscenities in a single post of yours. Again, by engaging in obscenities, you _lost the argument_ in the eyes of most people - if indeed, you had a logical argument, there would be no need to stoop to such lows.

>with that belief. THAT'S THE ISSUE - now damnit comment on that issue
>and quit trying to muddy the water in an attempt to smear me. No doubt

I've already commented on the issue. And have you seen me make any comments about any of the other individuals engaged in this argument on either side? This is not a "smear" campaign, simply a note that "arrogant, lousy, stupid piece of _fill in the blank_" does not add to credibility, and in fact, causes you to lose the argument by stooping to social lows.

Timothy A. Seufert (bwanga@cats.ucsc.edu) provided a detailed
and literate overview of the Falcon performance discussion when
he wrote:

[Many good points edited to save bandwidth]

: Such comparisons can break down easily, and when they do, what you end up
: with is an application benchmark, not a low-level performance benchmark.

That's been my point all along. I've been discussing system
performance, not CPU performance.

: In such a test you can't make a general statement about
: the performance of the two machines; you can only conclude that one is
: faster than the other when each runs its version of the same program.

Which is exactly what I mean when I say "On a system basis, and with
respect to the benchmark that was run, the Falcon was faster than the
Mac Quadra, the '486@66MHz, and the DEC Alpha."

: Several times you have strongly implied (maybe even explicitly stated)
: that the Falcon is faster than a DEC Alpha and almost any Mac or PC, and
: you have repeatedly used this so-called benchmark as support for the
: idea.

Actually, it's been James Woods that has claimed the Falcon's
superior performance in this one benchmark makes the Falcon a
superior computer in all areas. But instead of acknowledging
that it's his claim, he chooses to blame me for it instead.

: I hope that idea is now firmly laid to rest in your mind. If not,
: please explain.

That should just about clear up any lingering doubts.

-- George

From: dferran@crash.cts.com
Message-ID: <49mlq8$145@news3.cts.com>
Source record: 10877

The thoughtful and polite James Wood (jamesw@PEAK.ORG) wrote:

: > Since the DEC alpha completed the Mandelbrot benchmark in 5 seconds
: > and the Atari Falcon completed it in 4 seconds, the Falcon is obviously
: > faster than the Alpha when running this benchmark.

: After all of the commotion over this, and all of the people who know more
: about benchmarks than you and I (and who have more common sense than you)
: you still call this a "benchmark" and that the "Falcon is faster than a
: DEC Alpha." THAT IS THE BIGGEST LIE/ASSUMPTION I've ever seen on any
: computer-related newsgroup, and you earn an honorary dunce cap for such
: drivel. Let's drop it now.

You still haven't seen the "...when running this benchmark" qualifier?

And: a "benchmark" is "a reference point serving as a standard
for comparing or judging other things." Running a Mandelbrot
routine on a variety of computers allows a method of comparison.

: I think the biggest lie/assumption is your "Falcon faster than DEC
: Alpha" arguement. Period.

Hmmm ... a one-word sentence containing two "periods" usually indicates
dogma from a closed mind. I wonder if that's true here.

And: have you seen the "...when running this benchmark" qualifier?

: > 1. Only 20% of the games run on the Falcon. (Falcon owners
: > have reported a 50% rate here in c.s.a.a, and also note
: > that an overall 80% compatibility claim for all ST software
: > sounds reasonable and believable).

: I don't know where you got that 20%.

From you in a prior posting.

: You are totally unbelieveable. My point was that if 80% of the games run
: on the Falcon, then 80% of the games that Toad sells should be marked
: "Falcon compatible" when in fact it's a minority of games that they have
: advertised as indeed "tested with Falcon."

Falcon owners have reported a 50% rate here in c.s.a.a for games,
and also note that an overall 80% compatibility claim for **all**
ST software (spreadsheets, word processors, data bases, route
finders [on Hensa], etc.) sounds reasonable and believable.

: As far as "dumping non-working
: software" - that is your assumption that I said that. I never said that

: they intentionally engage in deceptive sales practices - more Crissman
: hogwash.

Actually I quoted your word-for-word comment in which you claimed
that Toad was dumping non-working software and overpriced Falcons.
(You never responded to it, BTW.) And it's true that you never
said they intentionally engage in deceptive sales practices, but
when you accuse them of dumping non-working software and selling
overpriced computers you are in effect making that accusation.

: That's all I have to say on the matter and I won't comment further.

Just like you said you weren't going to be following up my postings
anymore?

-- George

Precisely, which is why Mr. Woods' argument, replete with obscenities,
is wholly invalid - he misquoted you, and proceeded to spout obscenities
when you refused to assume this role that he assigned to you. As a seasoned
debater in APDA, I've come to be very keen at analyzing these things.

BTW: The Falcon Mandelbrot demo WAS a joke by Atari, I believe Bill Rehbock
as a matter of fact. I remember that at the WAACE show, during the Falcon
unveiling, during a smaller showing of Falcon capabilities, Bill even said
that Atari simply wished to prove the foolishness of using fractals as a
benchmark of performance. It certainly worked! Now - can we all agree that
the Falcon is NOT generally faster on a processor basis, and that it
SHOULDN'T BE? (After all, it starts at under $800, as opposed to
+- $10,000 for an Alpha machine. I doubt many people will be using Alphas
in their homes, or will jump to a Falcon instead of purchasing an Alpha-based
machine.)

Well sports fans, it's the bottom of the ninth with two outs, two strikes and Atari is down by five. GoldStar has inflected two strikes on Atari with a new $199 price on the their 3do with two controllers and two titles.

What will Atari do? The 3do is a much better deal since it costs less now..

Hopefuly Sony will reduce the PlayStation price if GoldStar's new pricing has an effect. 3do titles are about $10 more than PlayStation ones.

Why not? In the early 80's, Atari had "specials" about current
technology where they had nothing but commericals about the 2600 and the
800 computers. They even have a web page with those ads stored as
QuickTime movies :)

PETER SINCLAIR-DAY <sinclap2954@cobra.uni.edu> writes:

>What will Atari do? The 3do is a much better deal since it costs less now..

If I were Atari's chief stockholder, seeing as Mr. Tramiel has given up on internal development and fired every person that made Atari Atari other than Don Thomas (and if Bill Rehbock was considered "expendable", who ISN'T??), I would have a little sale.

First on the auction block: the Jaguar, lock stock and barrel. All rights to the hardware, any relevant software, licenses, agreements (all that are transferable). Starting price: $40 million.

Second on the auction block: exclusive rights to all of Atari's video game patents (the same that cost Sega and Nintendo dearly). These include rights to all future royalty payments from both or any other party. Starting price: $30 million.

Third on the list: the 8-bit computers. All licenses, patents, rights, etc. Start at $50,000 (not a typo). At least get something out of it.

Fourth on the list: the TOS computers. Sell all licenses, technologies, and patents to the TOS line. Start at $5 million. (Be willing to break into chunks and sell to different parties).

Fifth on the list: the Atari name and logo, with right to use for perpetuity. Start the price at $20 million (recognizable worldwide!)

Use the cash to pay off all creditors.

Liquad
Liquidate and disburse all remaining assets between shareholders. This would be the most lucrative way for a profit-taker to "cash in" on Atari. Whether it is a good move in the long run is tricky - it just may be if Jaguar sales don't heat up soon.

You don't know shit, what you're talking about.

TOS is NOT dead, it is still ACTIVELY being developed!!
C-Lab is developing TOS, while Application Systems is developing MagiC (a TOS-equivalent,
which also is avaiable for the Mac) - they have just released a
new version of MagiC, which is version 4. And it's FAAASST!!! Much much faster
than TOS 4.04 and features pre-emtive multitasking like MultiTOS but still faster.

> Mac software can't be matched in general by ST ones..Thats the fact Jack..

No??

Take CalamusSL for example - it beats the guts out of QuarkXpress!!

And generally, Atari programs are running a LOT faster than Mac programs.
If you wan't proof, just install MagiCMac on your Performa and see how Atari
programs fly compared to Mac programs - and by the way MagiC and MagiCMac
are PRE-EMTIVE multitasking OS's !!

Keep Cool and Flying...

OK... I'm looking for something Hard drive like to hook to a 1040stfm.
a bare icd board- adscsi, etc...
OR:
An older megafile, or similar external Atari HD, with a pooched drive
mechanism, but the adapter electronics still ok... I can come up with
whatever ancient MFM-whatever was in it....
(read below for swap, but I can pony up a bit'o $$ instead, if not
interested...)

I have.... (here come the random inquiries....)
something by ICD called an ADVANTAGE MICRO HOST ADAPTER. ICD sez it will
"allow you to easily install a 3.5" hard drive inside your Mega
computer". Comes with a power take off wire, a mount bracket, and a
little circuit board that clips onto the drive socket, and has a ribbon
cable that connects "to the DMA connector in the back left corner of the
computer" (inside the case).
(all quotes from manual)
There... that's ALL I know about it....
Want more info???? Call ICD. I don't have a Mega computer.
Also comes with manual and disk...

So..... you got some older ICD or whatever board to hook to the DMA
port,
OR:
one of those megafile external HD's, or similar with a seized drive
mechanism, and want to swap, drop a line....
Or If you have one of these for mucho cheap, and don't need a micro
whatever, drop a line too....

cheers...

Well it WOULD make sense, think about it. Say that 100,000 Jaguar packs are
sold over Christmas, now say that in each case the buyers dont buy any
additional games till after Christams. It therefore follows that
they may buy more games over next year. This is simple human nature,
not many people can stand only having ONE games to play!!

: >: faster than the other when each runs its version of the same program.
: >
: >Which is exactly what I mean when I say "On a system basis, and with
: >respect to the benchmark that was run, the Falcon was faster than the
: >Mac Quadra, the '486@66MHz, and the DEC Alpha."

: I still have a problem with this statement. Calling what happened a
: benchmark is just not accurate. In a benchmark test, some effort is
: expended to make sure that all variables but one are as controlled as
: possible. In this case, no such effort was made. It is an invalid test,
: and should not be called a benchmark.

In responding to a comment from Bob Retelle, I've separtely posted
several definitions of "benchmark". The most compelling statement was:

"You usually want to compare factors such as throughput and response
time in an environment that closely represents the systems that
will be run on the machine." (From "Systems Analysis and Design"
by H. L. Capron, (c) 1986 by The Benjamin/Cummings Publishing Co,
page 158).

Since the controlling factor was the "Mandelbrot" test, it is
not necessary to control any other factors when comparing system
performance. In fact, using "standard code" that ignores the
special architectural features of a machine will give an inaccurate
result.

: You could call it an applications test - Atari's Mandelbrot program vs.
: DEC's.

And in each case, it was recognized as a Mandelbrot program. It's
the controlling factor in this particular system comparison test.

: But in that case, it is misleading to say that "the Falcon was
: faster", because whether you intend to or not, it implies that
: the Falcon hardware is absolutely faster than DEC Alpha, Quadra, etc.

Ah -- now we have a question of whether I am "implying" something
or whether someone else is "inferring" something from my statements.

[This is one of those fine points of the English language that
many school teachers have given up on, BTW....]

Yes, I did say "the Falcon was faster when running this benchmark",
but it was James Wood who claimed that the Falcon was absolutely
faster than the DEC Alpha, Mac Quadra, etc for all applications,
although his claim was implied by his determined efforts to refute
it.

: After all, think about what would happen if you tossed a low-end PC
: running Fractint into the fray. Fractint is bloody fast, because they use
: extremely aggressive techniques to optimize Mandelbrot calculation. It
: doesn't even matter if the PC it runs on has a FPU. A low end 386 is
: probably sufficient to beat all the other times. Would that make you ever
: conclude, in any way, that the 386 was faster than the 486 used in DEC's
: test?

This is why I've been saying that the routine must be specifically
written for each target machine using an experienced programmer
with good knowledge of the computer the benchmark will run on.

brimiller@delphi.com wrote:
: Now - can we all agree that
: the Falcon is NOT generally faster on a processor basis, and that it
: _SHOULDN'T BE_? (After all, it starts at under $800, as opposed to
: +- $10,000 for an Alpha machine. I doubt many people will be using
: Alphas in their homes, or will jump to a Falcon instead of purchasing
: an Alpha-based machine.)

Hmmm ... but we haven't been comparing *only* central
processors. We've been comparing system performance,
which includes coprocessors such as the DSP and overhead
such as GEM and MS-Windows.

This whole thing started from my response to a "Falcon is
underpowered and overpriced" posting here in C.S.A.A. Now
that most of the shouting has died down, I believe it's
important to point out that people are most concerned with
system performance and not necessarily internal processor
performance.

If a 16 MHz 68030 Mac LC II feels slower to the user than
an 8 MHz 68000 Atari 520 ST, then the Mac user is not
receiving the benefits of the apparent "extra power" of
the higher clock speed or the improved processor.

Does the Falcon do some thing(s) well? Sure!
Does the PClone do some thing(s) well? Sure!
Does the MacIntosh do some thing(s) well? Sure!
(Don't tell sinclap I said that, BTW....)
Does the Alpha do some thing(s) well? Sure!
Does the Amiga do some thing(s) well? Sure!

The key is to match the computer to the user and the task.

3298. Benchmark Defined

Newsgroup: comp.sys.atari.advocacy
Date: 1995-12-05 00:00:00 UTC
From: dferran@crash.cts.com
Message-ID: <4a0hfd$kha@news2.cts.com>
Source record: 10803

It hasn't been that long since the illustrious Bob Retelle
suggested that my usage of the term "benchmark" was incorrect,
yet it has already scrolled of my service provider's disk.

Here are the results of my research into the meaning of the word:

Benchmarks are used to compare software packages:

1. "Computer professionals in a company often develop a series of
benchmark tests to help evaluate and compare software packages.
These tests are designed to ensure that the software product
can perform all of the processing required. Benchmark tests
allow potential users to compare the results obtained by
different packages under similar circumstances."
Computing Concepts for End Users [textbook]
by Nancy & Robert Stern, (c) 1990 by John Wiley & Sons, p. 218.

Benchmarks are used to compare computer throughput:

2. "Comparing computers involves more than just reading glossy
brochures and talking to vendors. At some point, some serious
efforts must be made to compare one machine to another in terms
of performance. A _benchmark_ is a formal performance test.
All kinds of benchmark tests are available, or you can invent
your own. You usually want to compare factors such as throughput
and response time in an environment that closely represents the
systems that will be run on the machine."
Systems Analysis and Design [textbook]
by H. L. Capron, (c) 1986 by The Benjamin/Cummings
Publishing Company, p. 158.

Benchmarks are used to compare equipment performance:

3. "Benchmark routine: A set of routines or problems that will help
determine the performance of a given piece of equipment."
Computer Dictionary by Charles Sippl, (c) 1985 by Howard W. Sams
Company, Inc., p. 36.

Benchmarks are used to compare system performance:

4. "Benchmark (benchmark problem): A problem that has been designed
to evaluate the performance of a system (hardware and software).
In a _benchmark_ _test_, a system is subjected to a known workload
and the performance of the system against this workload is
measured. Typically the purpose is to compare the measured
performance with that of other systems that have been subject to
the same benchmark test."

Dictionary of Computing by the Oxford University Press, (c) 1986.

5. "Benchmark: A benchmark program is a program used to test the performance of a computer or a piece of software. For example, the speed with which computers do arithmetic is often measured by running a prime-number-finding algorithm called the _Sieve_ _of_ _Eratosthenes_.
"Benchmark results are always somewhat untrustworthy because no single program tests all aspects of a computer's ooperation. A particular benchmark may exaggerate a difference between two machines that is unimportant in practice, or it may conceal an important differance."
Dictionary of Computer Terms, 2nd Edition, by Douglas Downing and Michael Covington, (c) 1989 by Barron's Educational Series, Inc., p. 38.

(The second paragraph reinforces my statements that the benchmark must be separately written for each machine by a skilled programmer who is knowledgable about the system to be used.)

... and for those who think "computer" or "equipment" means "CPU", the definition of computer is:

6. "A computer is a machine capable of executing instructions on data. .... Modern computers are made of high-speed electronic components that enable to computer to perform thousands of operations each second."
Dictionary of Computer Terms, 2nd Edition, by Douglas Downing and Michael Covington, (c) 1989 by Barron's Educational Series, Inc.

(The key word here is "components", or all the parts working together as a system.)

=-=-=-=-=-=-=-=-=-=-=-=-=-=

Given these souces of information, my usage of the word "benchmark" to compare system performance is correct.

I have a TT with 4 meg of memory, a 19 inch monitor that I would love to sell before christmas. It has been sitting lonely for the last
several months waiting for someone to use it. No one does. This system is going cheap. If you are interested, leave e-mail to
tthompso@pcshs.com.

I have alot of software to send if you are willing to pay the freight. (ie. Pure C. many terminal programs and a list will be made for the
buyer of the system.)

I also have an old ST 520 1meg machine, with mono monitor.

leave e-mail to tthompso@pcshs.com

"Feelings" have nothing to do with it. We are talking about quantitative
measures here.

>Does the Falcon do some thing(s) well? Sure!

Do you realise that you've just said that we're concerned with system
performance and not just CPU performance, and then gone and compared the
DEC Alpha (a CPU) to the Falcon, Macintosh, Amiga, and PC Clone?

Nobody can argue that it's not just the CPU that affects the computer's
speed -- of course it isn't! But there's still no way any sane person can
claim that a 68030-based Falcon at 16MHz with a 16-bit data bus is faster than
an Alpha-based machine, which runs at clock speeds of between 200 and 300MHz.

As far as I can tell, MacLinux is in an undead state. It could be going
great, except Apple is being very boneheaded about releasing hardware
register information for the PowerMac. At this point, what I'm
anticipating is the switch to CHRP: I am sure that the PowerPC Linux
project will target a version for CHRP, because Apple is going to sell a
lot of CHRP Macs and the CHRP specs are public information. Once that
happens, I will be a happy guy: I'll probably be able to run MacOS, Linux,
and BeOS all on the same machine.

Wrong. The exact algorithm used was not controlled, and this is a very important factor.

>In fact, using "standard code" that ignores the
>special architectural features of a machine will give an inaccurate
>result.

In very rare circumstances, your "standard code" argument might be valid. In this case, it is not. A DSP does not require the use of nonstandard algorithms to obtain its peak performance. It is just a processor optimized for certain math operations. By happy coincidence, Mandelbrot set calculations heavily use those same math operations.

>: You could call it an applications test - Atari's Mandelbrot program vs.
>: DEC's.
>
>And in each case, it was recognized as a Mandelbrot program. It's
>the controlling factor in this particular system comparison test.

You don't get the picture, do you? Differing algorithms can be used to implement a Mandelbrot program. (Surprisingly different, given how simple calculating the Mandelbrot set seems!) For a meaningful test, the same algorithm must be used in each Mandelbrot program.

[...]

>

>This is why I've been saying that the routine must be specifically
>written for each target machine using an experienced programmer
>with good knowledge of the computer the benchmark will run on.

And you are wrong. If you want to know what you're actually measuring when you compare two machines, you can't use completely different algorithms. You must use the same algorithms.

Now, Fractint is written by experienced programmers with detailed knowledge of the PC - just what you profess to like. So, by your logic, DEC should have run Fractint on the 486 they were using for their demonstration, and their own program on the Alpha and the Mac Quadra. If they had done so, they would have been forced to conclude that a 486 was faster than their own Alpha processor, since Fractint on a 486DX2-66 is easily capable of drawing full-set 256 color 1024x768 Mandelbrot pictures in under 2 seconds.

But do you know something? None of the techniques used in Fractint are PC-specific. Various ports to other architectures (including the ST) have existed from time to time. The reasons why it is fast have nothing at all to do with any special features of PC hardware or the x86 processor series.

Please read a basic computer science text that covers benchmarks and performance metrics. I haven't been able to get the concepts through to you; maybe a book can. I recommend "Computer Organization and Design" by Patterson and Hennessy, published by Morgan Kaufmann.

The Jag's been out for what two years now, and there barely any decent games for it. Between the lazy game programers, the biased media who still remember that stupid thing with the 2600(that was over 10 years ago folks) and the way the Tramiels run the business(I loved how they "drop" the ST's to support the Jag only to have the stock tumble the next day); is it any wonder why the Jag is not doing so well? The empty promises over the years don't exactly help either.

> Well it WOULD make sense, think about it. Say that 100,000 Jaguar packs are

But what if the games are not as good as, say the ones from the 8-bit NES? Jeff Minter can't continue to carry the Jag on his games alone. The designers should put alot more effort in design excellent games for the Jag, I mean we should see lots of texture-mapping that the other guys have. And maybe if Atari Corp would stop treating their programmers like garbage, we can see some real output here.

As it stands for me, the Jag is only worth getting for the stuff Minter wrote. :)

>suggested that my usage of the term "benchmark" was incorrect,
>yet it has already scrolled of my service provider's disk.
>
>Here are the results of my research into the meaning of the word:

Here is what Webster's online dictionary says:

bench mark or bench-mark n. 1. A surveyor's mark made on a stationary
object of previously determined position and elevation and used as a
reference point in tidal observations and surveys. 2. benchmark. A
standard by which something can be measured or judged.

Obviously definition 1 doesn't apply to us. Look at definition 2 -- a
standard. If I test computer A by performing a linear search on 1000
elements in an array, and computer B by performing a binary search on 1000
elements in an array, that is not a benchmark of performance because there
is no standardisation.

Here's a non-computer analogy: Suppose Joe and Fred want to figure out who
has the faster car. They decide to race from New York to Los Angeles to see
who gets there first -- the person who gets there first will be deemed the
person with the fastest car. Fair, right?

Joe drives from New York to Los Angeles straight (as straight as possible)
across the US. Fred drives south from New York to the southern tip of Chile
and then north from Chile to Los Angeles. Joe arrives in a few days. Fred
arrives in a few months. Does that mean that Fred has the slower car? No,
because Fred drove a totally different route! The different arrival times
have nothing to do with the cars. It's exactly like the fable of the tortoise
and the hare: the tortoise didn't win the race because he was faster.
It's obvious to anyone that tortoises are slower than hares!

>1. "Computer professionals in a company often develop a series of

What would happen if you want to compare the performance of Microsoft Word
to the performance of Novell Wordperfect? You would devise a series of tests
that test the features whose speeds you are interested in comparing. For
example, your series of tests might includes searching a large text file,

printing a file, opening files, changing fonts, and so on. You would then proceed to run these tests, making sure that you are using the same files. It wouldn't be fair to ask Microsoft Word to search through a 500-page file and ask WordPerfect to search through a 1-page file, would it? Of course not. You try to control as many variables as possible.

So suppose I run WordPerfect on a 4.77MHz 8086 and Microsoft Word on a 133MHz Pentium. Will my results be accurate? Obviously Microsoft Word will be the winner, all jokes about Microsoft's programming aside. Is this comparison fair? Of course not. Microsoft Word wins not because it is better written or because it is more efficient, it wins because it is running on a much faster machine. In other words, Word's fast execution time has nothing to do with Word itself!

>4. "Benchmark (benchmark problem): A problem that has been designed

> and the performance of the system against this workload is
> measured. Typically the purpose is to compare the measured
> performance with that of other systems that have been subject to
> the same benchmark test."

Exactly. The system is subjected to a KNOWN WORKLOAD. In the Atari-DEC test, this did not happen. We have no guarantee that the workload in the Atari Mandelbrot problem was the same as in the DEC program. Special features have nothing to do with this. The point is that since there was no attempt to ensure that the algorithm used on the Falcon was exactly the same as the one used on the Alpha machine (and the agorithm can be the same without the code being the same, thus allowing these "special features" to which you refer to be used) we have no way of knowing whether the fast Atari results are due to the fact that the Falcon is faster than an Alpha, or the fact that the alogrithm Atari used was inherently faster than the one used on the Alpha machine.

> "Benchmark results are always somewhat untrustworthy because no

> important differance."
>
> (The second paragraph reinforces my statements that the benchmark
> must be separately written for each machine by a skilled
> programmer who is knowledgable about the system to be used.)

It does no such thing. It just says that no benchmark can provide a true measure of how the computer reacts as a whole. Suppose computer A does operation X very quickly and operation Y slowly, and computer B does operation X very slowly and operation Y very quickly. It's easy to write a benchmark that tests only operation X -- in such a benchmark, computer A would come out looking very fast, and computer B would come out looking very slow. But if operation X only once in an average program, and operation Y is used hundreds of times in an average program, then it will be computer that will be faster

in real life. That's all the quote is trying to say -- than benchmarks can
easily be manipulated.

No. The controlling factor is not "The Mandelbrot test," because there is
no such thing as "The Mandelbrot test." That's a vague and nebulous term.
Benchmarks must be strictly defined in order to be meaningful.

You have to specify the algorithm that is to be used, not the type of task
to be performed. I could perform another Atari/DEC test and call the
controlling factor "A Search through a list of a million elements." That's
useless, because there are many algorithms that can be used to search through
a list of a million elements -- each of which will have different execution
times *on the same machine*.

>: You could call it an applications test - Atari's Mandelbrot program vs.

Would you re-read what he said? It has nothing to do with routines being
"specifically written" and "experienced programmers with good knowledge."
It has to do with algorithms being totally different. If you don't control
the algorithm, then any variation in execution time can be attributed to
either the algorthmic differences or hardware differences.

The threat of a monopoly is gone. Microsoft announced their Network will become a part of the Internet instead of a closed and fully M$ controlled Lemmingworld. The freemarket forced them to let go their dream of total control on information.
The concept of the open interface is winning. In the future any system will do as long as it is able to interpret HTML and Java.
In the near future people can look for quality and productivity instead of compatibility to old fashioned standards. In the network of the future (office and Internet alike) nobody at no office will care if you use either a Compaq, a Bebox, a Macintosh, an Amiga, an Atari, or your televisionset. You may even build your own computer and use an operating system you've written yourself. Nobody will care.

The point was that the algorithms aren't known to be the same; the Falcon program most likely produced what looked to be the same thing with more time-efficient techniques. In the original DEC comparison, relative times are somewhat consistent with reality; it simply defies reality that the Falcon could outperform all those platforms (let alone the Alpha). If it did, it would be hailed as "Mandelbrot Computer of the Year" and we'd have read about it in BYTE magazine by now.

>
> Ah -- now we have a question of whether I am "implying" something

Remember this advice of yours, because a few lines down, I'll call upon you to heed your own word.

>
> [This is one of those fine points of the English language that
> many school teachers have given up on, BTW....]
>
> Yes, I did say "the Falcon was faster when running this benchmark",
> but it was James Wood who claimed that the Falcon was absolutely
> faster than the DEC Alpha, Mac Quadra, etc for all applications,
> although his claim was implied by his determined efforts to refute
> it.

This is completely untrue; this is pure and complete inference on your part. I claimed that you believe the Falcon to be faster. In how many ways do you believe it to be faster? I don't know, and I really don't care. All I know of now is at least one, and I disagree. I don't beleive the Falcon is faster than a DEC Alpha in **any** way and therefore I am forced to disagree with you on the basis that you believe the Falcon faster than the Alpha on what you term to be a "mandelbrot benchmark." Can we lay this issue to rest now?

Just for clarification, I'd like to make my closing remarks:

1) I apologize to those who have claimed to be offended. More than one person called names, and therefore more than one person is guilty.

If I called names, evidently I was frustrated at the time because of what seems to be a communication failure that will always endure. We gave it a shot, but we'll never see it each other's way so let's drop it.

2) If the "who called names first" label is important to you, I found the one most noteworthy incident to be when Brian Quimland jumped in the thread and accused me of "replacing Sinclair as the intellectual void" (I think it was; I really didn't pay close attention to exactly what was said). As far as I know, that was the first posting he had in thread concerning me and it was certainly taking a shot at me. Yet all the while, he's screamed the loudest and pointed the most fingers at me for such behavior? What gives? I concluded that he was a hypocrite immediately. I don't really care what he thinks, and his criticisms may as well be internalized since they'll do nothing but bait flame. (I mean please....does he really think I'm going to respect the opinion of a hypocrite?

3. I never said that George Crissman argues the Falcon faster than the Alpha in all ways. I said that he argues the Falcon faster than the Alpha, and I don't know in how many ways. I know of at least one - what he beleives to be the Mandelbrot "benchmark" - and that's all I need to qualify the sentence "George Crissman argues the Falcon is faster than a DEC Alpha" while it does not qualiify the statement "George Crissman argues the Falcon is faster than the Alpha in all ways." This is ridiculous that maintaining your stance has come to the point of trying to hide in little ambiguities such as this. "How many ways you believe" or "how many ways I've said" doesn't help the real jist of this thread (1) The Falcon is not faster than the Alpha (in any ways) and (2) The Atari advertisement Falcon Mandelbrot time is not known to be an accurate benchmark to qualify your belief in the minds of others. I'm not trying to distort your arguement, I want to say that I disagree, and I see a hell of a lot more people who disagree with you than who agree.

4. I really want out of this particular thread, but I keep finding references to ME - and they're misrepresentive of me. It would be really nice if you could quit and I could get out. Let's try and both take a step down and back; you have plenty of other challengers.

James

To whom? To whom else would the Jaguar be worth anything, let alone $40
million? Where did you get that figure from anyway? Why would they want
to sell the Jaguar? Why not just sell Atari? What would their business
comprise if not for the Jaguar?

> ___
> Second on the auction block: exclusive rights to all of Atari's video game
> patents (the same that cost Sega and Nintendo dearly). These include rights
> to all future royalty payments from both or any other party. Starting price:
> $30 million.

How do yo get that price? How can you determine
what they are worth? Who knows how far this can go? I've read reports
that Atari may even own patents on concepts as basic as a scolling video
game screen. Maybe there's even more patent infringement litgation that
could generate untold revenue for Atari, maybe not. Unless they've sued
all they're going to, why would they sell, and for $30 million?

> ___
> Third on the list: the 8-bit computers. All licenses, patents, rights, etc.
> Start at $50,000 (not a typo). At least get something out of it.

I think 8-bit users have taken enough of a beating, as have those few who
have struggled to exist as hardware/software developers for these beloved
machines. There is almost no profit margin at all in making 8-bit Atari
hardware, and this stuff should have been GIVEN (not a typo either) to
the 8-bit community in public domain a long time ago. The most Atari can
hope for (rather than $50,000) is that maybe a group of die-hard
8-bitters will reciprocate by raising their opinions of the company and
move a step closer to buying Atari hardware in the future. Why $50,000?

> ___
> Fourth on the list: the TOS computers. Sell all licenses, technologies, and
> patents to the TOS line. Start at $5 million. (Be willing to break into
> chunks and sell to different parties).

Agreed, they should sell this, unless they plan to start making computers
again in the future. However, why $5 million? You sound like you're
trying to be a corporate CEO here. Where do you get your information,
and what criteria do you bring into generating your specific sale prices?

> ___
> Fifth on the list: the Atari name and logo, with right to use for perpetuity.
> Start the price at $20 million (recognizable worldwide!)

Perhaps one of the Jaguar's biggest flaws is that it bears this very
logo. There are lots of users who have felt alienated and others
(retailers, etc) who felt screwed by this name and logo. Why would
anyone want this name for a whopping $20 million? Maybe in the early
eighties, but again, where do you get these specific figures?

>
> Use the cash to pay off all creditors.

One would hope they'd use the cash in the most appropriate manner, would
one not?

Just on the miniscule cable channels. Isn't it sad that the $129 SNES continues
to outsell the supposely 64 bit Jag for a few dollars more...

Judging from the Jaguar's market presence here in Germany (virtually none,
you never see this thing in ads or even stores), I'd say Atari would
have to have a pretty good marketing attack under way in the US if they
wanted to sell 100000 Jaguars. Are there any commercials for the Jaguar
in the US? Can you actually see Jaguars in the toy and video game
stores?

Of course not. At the time where Atari made that MandelBrot-demonstration, it was
meant as a practical joke. Of course Atari knew that the Falcon wasn't
nearly as fast as an DEC Alpha-machine. As I said, it was a pratical joke!

And by the way, the Falcon's BUS is not entirely 16-bit, the expansion BUS is 32-bit.

>> transferable). Starting price: $40 million.
>
>To whom? To whom else would the Jaguar be worth anything, let alone $40
>million? Where did you get that figure from anyway? Why would they want

Not just Jaguar, but licenses and patents as well. The figure is based on approximate cost of development, potential licensing agreements that could be engaged in, net revenues from a properly marketed and supported Jaguar. Originally, the price would be much higher, since the only other method of gaining the Jaguar would be to buy controlling interest in Atari (which would cost between $30 and $50 million, depending on stock prices, and probably even higher, since when takeover bids start, prices expand dramatically. It also assumes that Tramiel would sell part of his holding, and if he would, it would be at a very high price.

>> $30 million.
>
>How do yo get that price? How can you determine
>what they are worth? Who knows how far this can go? I've read reports
>that Atari may even own patents on concepts as basic as a scolling video
>game screen. Maybe there's even more patent infringement litgation that
>could generate untold revenue for Atari, maybe not. Unless they've sued
>all they're going to, why would they sell, and for $30 million?

Remember, this is not a "maximize value" concept, in which we wait over time to get the most revenue possible. This is strictly a "maximize my revenue _NOW_" from a major investor holding Atari stock's standpoint. Waiting for years for Atari to maximize revenue is foolishness. Incidentally, the selling price is less than the money value of Atari's current settlements and doesn't include future settlements. From a time-value of money standpoint, and this historical Atari screw-up factor, this is about the minimum price I would set at an auction (where the price could be bid up).

>I think 8-bit users have taken enough of a beating, as have those few who

>8-bitters will reciprocate by raising their opinions of the company and
>move a step closer to buying Atari hardware in the future. Why $50,000?

Actually, the eight-bit hardware has a well-documented development system, which could make it valuable in embedded-control applications, and thus, to developers (albeit, this hardware _IS_ dated, which is the reason for the lower price). The remaining 8-bit developers could manufacture clones under license to the new owner (who may have a higher tendency to do this than someone else). Remember again, we aren't looking at future values here, just at how a shareholder could get guaranteed money NOW, instead of vapourous money (like 8-bitters buying Atari products) later. Under this scenario, Atari would cease trading, and would be in full liquidation (and many of its best products would be in better hands).

>> patents to the TOS line. Start at $5 million. (Be willing to break into
>> chunks and sell to different parties).
>
>Agreed, they should sell this, unless they plan to start making computers
>again in the future. However, why $5 million? You sound like you're
>trying to be a corporate CEO here. Where do you get your information,
>and what criteria do you bring into generating your specific sale prices?

I base this number on the amount of Falcons sold. With 100,000 Falcons, $5 million is not an unreasonable profit number if they are marketed correctly. Also, $5 million would be generated probably by selling different rights to different parties (like selling VIDEL rights for $100,000 [a complete video subsystem for $100K is a steal]), etc.

>> Start the price at $20 million (recognizable worldwide!)
>
>Perhaps one of the Jaguar's biggest flaws is that it bears this very
>logo. There are lots of users who have felt alienated and others
>(retailers, etc) who felt screwed by this name and logo. Why would
>anyone want this name for a whopping $20 million? Maybe in the early
>eighties, but again, where do you get these specific figures?

Atari has name recognition that many other companies would _KILL_ for. The ATari name, worldwide, since its inception, has sold over $4.5 billion in products since the beginning. Atari still commands strong brand recognition. Again, this is an auction, and if the price is too high for SOMEONE to bid on (which I doubt), it could always be reduced at the end. The primary goal here is to get money for the shareholders, before Tramiels flush the value of the company completely down the toilet.

>> Use the cash to pay off all creditors.
>
>
>One would hope they'd use the cash in the most appropriate manner, would
>one not?

Of course - we're maximizing immediate returns, right?

>You must be a very wealthy investor, then? You seem to be full of good
>advice. I don't mean to flamebait you, but what are your credentials in
>this area?

My financial status would not be an accurate reflection of this proposal (Tramiels are very wealthy, but are hardly barometers for wise business decisions). My point was that, if I were a major stockholder, I would sell the assets NOW, while they still have value. If the Jaguar fails and Atari goes bankrupt, the value of the company would be FAR less (just look at Commodore - it had market cap of $99 million before liquidation, yet sold for about $12
million when all was said and done.)

As to my status, I am a student in the top 5% of my class at a certain business school ranked as the best business specialty school for 6 years (I'll let you research that latter remark since it captivates you so).

Atari will not release any new TOS version, true. However, MultiTOS
development is "continued" by Overscan in Germany, who developed N AES,
an AES replacement for the buggy and slow GEM.SYS of MultiTOS; it will be
shipped together with Thing (a Desktop replacement) and MinT; shippment
will begin on Dexcember 11, 95. The program was shown on the ProTOS show
in Heneff, Germany, and performed very well.
Upgrades for MultiTOS 1.0x users are available, so you can say NAES is
the sucessor of MultiTOS
Alterbatively, ypu can buy Magic 4.0
It is also said, that C-Lab are working on TOS 5.0, but until sth. is
shown, one can't say anything about this; as NAES and Magic4 prove are
good quality work, there is no need for TOS 5.0.

Well, then, quick question: why are you arguing with an "insane" person?
Perhaps because he isn't making that claim, and that you simply threw that
in as a red herring?

I believe the inherent conflict here is not which computer is faster on a
mathematical basis, but simply, which computer is fastest on an everyday
basis (not that this really matters either).

The primary reason why I use a Falcon is that it gives me a competitive edge:
in this college, competition is everything, and beating out the competition
is easy with a Falcon. After one sees the hundredth PowerPoint presentation
given, we all yawn and say "that's nice, I already know how much time you
spent preparing that and how you did it." My multimedia videotaped
presentations using the Falcon and initially the lowly Ani-ST, later, Apex
Media, leaves
them guessing. Not only is the output superior, but the versatility is there,
and the DIFFERENCE is there - making my presentations memorable in a positive
fashion. Does this make _fill_in_the_blank_ worse/slower/whatever than the
Falcon? Definitely, for my applications. Knowledge of a 16-MHz Falcon's
software and way of doing things has helped me consistently beat other
people with the fastest Pentiums and PPC's on the market.

Attempting to maintain a monopoly on hardware register information in this day and age is akin to denying developers any kind of development tools until they "register" with you and pay $100 or so a year (even Atari abandoned this requirement years ago).

But there is a product one might refer to as "MTOS II", it's N.AES, a replacement for the slow AES 4.x that shipped with the original MTOS.

If the M2 is backwards compatible with the existing library, who cares! What will you say if a miracle happens that Atari releases the Jag II.

Just bought a GoldStar 3do for $199. A X-mas gift for myself..FIFA Soccer is awesome..

I think Deep Blue C did a decent job of compilation, but your point is well taken. There would have to be some way of getting some money out of the 8-bit (even though they should have done it many, many years ago, instead of waiting until it was virtually worthless).

I seem to remember reading about TI/994a users buying the DOS that TI originally owned for that machine. If a few thousand TI users could do it, isn't it possible that a few thousand 8-bit users could do it? I just have a problem with giving away technology that cost millions to develop, that's all.

PISCHKE DAVID <pischke@ecf.toronto.edu> writes:

>No, I'm not. He claimed that the Falcon was faster calculating the Mandelbrot
>set than a DEC Alpha-based machine. I am saying that it cannot and is not.

Ah, but not that, and I quote, "a 68030-based Falcon at 16 MHz with a 16-bit data bus is faster than an Alpha based machine..." Obviously, that was thrown in as a red herring - the suggestion that he was arguing that the Falcon is faster in all areas, instead of in this specific area.

Again, (how many times does this point have to be made?), it is purely DEC's fault that this happened the way it did. It was none other than DEC who inferred that Mandelbrot fractal generation was an accurate test of processor and system performance. Atari proved them wrong by generating a Mandelbrot program that performed faster than the DEC one, leaving a little egg on their face. By DEC's own logic, sine the Alpha-based machine was slower at generating fractals, it is slower, period. Of course this isn't true, but I do remind
you that DEC was the original propogator of this contention. Of course, in a real world environment, a person would care not whether the "algorithm was more optimized for the Falcon." A person who would buy a computer solely for fractal generation (uh, probably not many) would buy the machine that performed fastest at that application, in this case, the Falcon. So either DEC's programmers write atrocious, bloated code, or Atari writes VERY fast code, or both. Either way, in a real world environment, the Falcon performed faster, and that's all that matters to the end user. Looks like DEC will have to program a little tighter, or they may have an A1200 beating them in fractal generation at the next major trade show. :')

This is why Be, Inc.'s project is so exciting - creating an open platform, fully documented, and available to everyone, will allow optimization of code like no-one's business (I can just see the debate on comp.sys.be.advocacy in 1999 - "The Be is faster in making Mandelbrot fractals than a 500MHz P7. No it's not, bonehead. Yes it is, &*&*!).

I think the days of sacred tomes of registers, available only to a chosen few are over - and that if Apple, etc. don't recognize this, developers will abandon them for developer-friendly platforms (like the Be).

The M2 upgrade and console will not be widely available until next fall. So that will be three years for the life span of the M1. What about computer owners who bought Pentiums this period when price cuts next month will result upto a 50% price reduction? Thats life. Never be an early adopter to anything.

I should beable to buy a fast closeout Powermac model in the next two months close to $1000 with 4x cdrom. I suppose I am patient now. Its nice to receive a free subscription of MacWeek!

If the the Jag falls below $100, I may swing one with Defender and Missle Command. I miss the old classics.

Shockwave is awesome if you like shoot em ups. I think the game play is a little too fast. Its like a computer game program and not a video console one. You will like it. I bougt the last GoldStar one. Looks like Panasonic will have to reduce prices.

I own Freedom, so I don't need another File Selector with these features,
e.g..

I don't know about the other features of N.AES yet, though.

Don't put words in my mouth. I never claimed that George Crissman made any such statement. He stated several times that this Mandelbrot demonstration indicated that the Falcon was faster at this benchmark than the Alpha. My point was that this is *not* a benchmark.

>Again, (how many times does this point have to be made?), it is purely DEC's

>remind
>you that DEC was the original propogator of this contention.

There are two issues here: You are putting words in DEC's mouth when you say that "since the Alpha-based machine was slower at generating fractals, it is slower, period." DEC never said that.

When you say that "Atari proved [DEC] wrong by generating a Mandelbrot program that performed faster that the DEC one," you are wrong. Atari didn't prove anyone wrong. You have missed the point. If Atari wrote a Mandelbrot program that *used the same algorithm as DEC's* and still performed faster, then I would be inclined to agree. Calculation of the Mandelbrot set can be used to benchmark processor performance *IF* the algorithm is controlled. (Whether or not the test will indicate the performance of real applications is another issue entirely, although it still should give a general idea of the performance that can be expected.)

The second point is that this was *not* a benchmark. Mandelbrot may or may not be a meaningful test of processor and system performance -- that is a separate issue. The point, *once again*, is that any comparison of system performance based on calculation of the Mandelbrot set will be meaningless unless we make sure that everybody uses the same algorithm! Otherwise, we can't be sure that differences are attributed to the software or the hardware!

> Of course, in a
>real world environment, a person would care not whether the "algorithm was
>more optimized for the Falcon."

You don't understand. Algorithms have nothing to do with Falcons, Alphas,
or 486s. Algorithms are not optimised for hardware; programs are.

An algorithm is an abstract concept that exists independently of any hardware
in the real world. An algorithm can be said to be faster than some other
algorithm if that algorithm gives the same results in fewer steps. It has
nothing to do with the Falcon. Speaking in terms *only* of the basic
instructions required to execute any algorithm, there is nothing that a Falcon
can do that can't be done by other computers. The DSP may be able do so some
things faster, but it isn't doing anything *different*.

You seem to be confusing harware benchmarks (*that* is the issue here) and
software benchmarks. If you are writing a hardware benchmark, you attempt
to keep the software the same. If you are writing a software benchmark,
you attempt to keep the hardware the same. It is much easier to control
hardware than software, but it's still possible to do a reasonable job of
making sure that the hardware is the *only* factor that affects performance--
no such attempt was made here.

In any case, we're not talking about a "real world environment." We're not
talking about how fast a machine runs real applications. We're talking about
the inability of certain people on this newsgroup to understand why this
particular Mandelbrot demonstration is not a valid indication of processor (or
system, for that matter) performance.

>A person who would buy a computer solely
>for fractal generation (uh, probably not many) would buy the machine that
>performed fastest at that application, in this case, the Falcon. So either
>DEC's programmers write atrocious, bloated code, or Atari writes VERY fast
>code, or both.

The point was not to write a commercial Fractal generating package; the point
of DEC's test (and please note that DEC's test did *not* include the Falcon;
Atari wrote their own Mandelbrot generator later) was to test CPU performance.
In a benchmark, it doesn't matter how bloated the code is. All that matters
is the *relative* performance. Benchmarks are not real-world applications.
They are tests of processor performance. They are *not* tests of programming
skill. (Note that the task of designing a meaningful benchmark and the
actual programming of it are two different things.)

DEC could easily have rewritten their program to use faster code. Then the
Alpha-based machine would have ended up beating the Falcon again. The point
ist that DEC was not trying to write the world's fastest Mandelbrot algorithm,
they were trying to demonstrate differences in processor performance!

> Either way, in a real world environment, the Falcon performed
>faster, and that's all that matters to the end user. Looks like DEC will
>have to program a little tighter, or they may have an A1200 beating them
>in fractal generation at the next major trade show. :')

This was not a real world environment.

You are wrong - it's 16-bit, and has only 24 address lines (=16 MB address space). Stupid, but true. I talked about this once with Jim Allen (I think that's his last name), of FAST Technology (he was its owner and only employee). He said that basically the only way to get at all the data lines of the 68030 in the Falcon is to plant a test clip on the chip itself - the upper 16 bits just aren't connected to anything in the system.

Atari abandoned seriously trying to make computers years ago.

You need to distinguish better between development tools and development documentation. Tools (i.e. compilers) are not now, and probably never will be, free. No matter what OS you're talking about you gotta buy them. Documentation is also usually charged for, and support is most definitely not free.

In Apple's case, the only developers who actually do need hardware register info are those trying to write new operating systems for the computer. Otherwise, you just FTP to ftp.info.apple.com, and grab as much of the Inside Macintosh documentation in electronic form as you want. Free. You'll get everything you need to know about programming under the MacOS from those books. Apple just isn't interested in offering its internal hardware documentation to the public, and probably from their standpoint there's no reason to do so. They do have plenty of hardware documentation for things that are meant to be expansion interfaces - i.e. NuBus, PCI, processor direct slots, modem slots, etc. I happen to think they're being stupid in not telling us anything about the inner workings of the hardware on their own boards, but that doesn't equate to them being evil and nasty to *all* developers.

Not releasing hardware register info is not unique to Apple, either. For a long time Linux did not support an entire brand of video card in any mode better than VGA (VGA registers are standard across all cards), because the vendor refused to tell them the information they needed to create a SVGA driver.

Yep! N AES is fully AES 4.1 compatible, the last unreleased version of
Ataris AES; the file selector in AES is, however, a very simple one, and
the package inckludes and alternative fileselector (with all the features
you might want, including long file names).
NAEs has also improvements such as the ability to switch the menubar off.
Magic4.0 has also lots of AES imorpvemnets such as an enormously improved
file selector boy, the ability to put dialogs in windows and an
integrated font selector for GDOS that can be used by applications like
the file selector.

The Atari 8-bit hardware is worthless for embedded control It has all sorts of baggage that is needed for a home computer but is just extra cost, power consumption, and size for an embedded control computer. It has limited amounts of control I/O - bidirectional digital port bits and a couple of *very* crude analog inputs - so if you need more you have to add in new decoding logic and more chips, which can be quite expensive as it could involve redesigning the board. If you designed out the junk not needed for the control application at the same time, you wouldn't have an Atari 8-bit computer any more, and you would have been better off just doing it yourself from scratch. Small boards built around a microcontroller are very simple and cheap to design and build.

The development system argument is not really that great, either - people today want to use a good version of C that outputs decently optimized code, and I don't think there ever was such a thing for the Atari 8-bit series. There are many good C compiler packages for the major microcontrollers (HC11, 8051, etc.) already out there.

>Well, then, quick question: why are you arguing with an "insane" person?
>Perhaps because he isn't making that claim, and that you simply threw that
>in as a red herring?

No, I'm not. He claimed that the Falcon was faster calculating the Mandelbrot
set than a DEC Alpha-based machine. I am saying that it cannot and is not.
I'm saying that the fact that the Falcon appeared to calculate the Mandelbrot
set faster is because the algorithm it used was more efficient, and not because
a 16MHz 68030 with 32MHz Motorola DSP is faster than a 300MHz DEC Alpha.

>I believe the inherent conflict here is not which computer is faster on a
>mathematical basis, but simply, which computer is fastest on an everyday
>basis (not that this really matters either).

It is not.

>faster, and that's all that matters to the end user. Looks like DEC will
>have to program a little tighter, or they may have an A1200 beating them
>in fractal generation at the next major trade show. :')

This argument is getting silly. DEC was trying to show the speed of their
processor and not the cleverness of their software designers. By your logic
their would be no way of standardizing the testing of hardware. The
contest would often go to the cleverest software designer and not the
best hardware. If you gave both the DEC team and the Atari team a week
to write slick code then I'm sure that DEC would cream Atari. But DEC,
because they really wanted to test hardware performance, didn't do that.
As for what system to buy, you should go with the best overall performer,
in both hardware and software. That means real applications, not hacks
that that some engineer thought up one night.

>The key is to match the computer to the user and the task.

Ah..!

Ok then... if all you want to do is run Mandelbrot calculations, with an unspecified degree of precision and an unspecified number of iterations, then for sure, buy a Falcon...

Makes those buying decisions a lot easier to know that...

>In responding to a comment from Bob Retelle...

My comment was that calling the comparison a "benchmark" was inaccurate.

Regardless of the selected quotations George has provided us with, I still stand by that statement.

George still hasn't provided any details as to the specifics of the algorithms used, the precision of the calculations or the number of iterations run for each different machine.

Without carefully controlled methodology, there is no "benchmark", only a contrived demonstration.

George's use of the word "benchmark" continues to be inaccurate.

>
>Followups redirected to comp.sys.mac.advocacy.

If Apple was so gung-ho about open platforms, Linux for Mac would be complete
by now. It's been mostly Apple's malevolent machinations that have prevented
the "Mac OS box with common hardware" from coming about. View their refusal to
allow Gateway to clone Mac hardware.

Supposing that I was a developer of an alternative OS (like Linux), and I
approached Apple and Be seperately, who would give me register-level info
willingly? Be, of course. Who would withhold information? Apple, of course.
Until Apple is truly ready to make register-level calls available for
developers, I view the CHRP hype by Apple as having as much validity as
a Tramiel marketing promise.

BTW: The first company to really get on the CHRP bandwagon is none other than
Be, and Apple will have to change their strategy toward open systems to
resemble Be, dropping the imperious, secretive nature of restricting
development information.

>Does anyone know when Atari will release it?

I bet you read that in the ACN mag. I've seen it too - it looks suspiciously much like they've got a copy of AES 4.1. All the features they mention are in that. AES 4.1 is, however, not completely bug-free (and not `completely legally' available...) but there is now N.AES, fully compatible with it, and (hopefully) soon XaAES by Craig Graham, which will be published under GPL. (How's it going, Craig?) I will probably get them both.

PS. don't believe everything ACN says. There are often blatant errors and nonsense in their reviews.

PPS. Julian Reschke, are you reading this? Your name was mentioned in that article as `one of the advisors' of Atari's programming team making MultiTOS II, which allegedly had Eric Smith and Bill Rehbock (or that other famous Atarian) in it. How much is true of that?

It does indeed sound like ACN is describing AES 4.1, which is pretty old news. Julian certainly gave us good advice about that, and Bill Rehbock and I were among the people at Atari who worked on it.

Since neither Bill nor I are currently working for Atari, you may safely assume that ACN's information is out of date. I do not know what plans, if any, Atari may have for AES 4.1.

(I've set followups to comp.sys.atari.st, since I don't read .advocacy and the topic doesn't quite seem to fit in .tech.)

3356. Atari Clone Names

Newsgroup: comp.sys.atari.advocacy
Date: 1995-12-12 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4aiunk$764@inca01.inca.co.nz>
Source record: 10711
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Has anyone noticed that the names of Atari clones are based on old (usually Greek) mythology?

For example, take Medusa. She was one of the three Gorgon sisters [Stheno, Euryale, Medusa] with snakes for hair that would turn you to stone if you looked at her.

Or, for that matter Hades.

Hades :
"(1) The gloomy subterranean abode of departed spirits or shades over which Pluto [lord of the underworld] ruled.
(2) [in the Revised Version of the New Testament] the abode or state of the dead.
(3) [colloquially] Hell"

Not an exactly warming name for the product, is it?

if you were to buy a computer, and were given three choices 1) Model 2349/23A, 2) "Medusa" or 3) "Hades", which would you pick?

If it were me, I would shy away from the negatively-named products.

And what is wrong with using names from Greek mythology that have positive names? "Zeus" [the chief god of the Ancient Greeks, ruler of the heavens] for example?

In article <xDKmkdU.brimiller@delphi.com>, brimiller@delphi.com wrote:

>If Apple was so gung-ho about open platforms, Linux for Mac would be complete
>by now.

They are gung-ho about open platforms. Their current hardware is emphatically not an open platform. I don't know why they choose to do that, but they do. Their future hardware is, on the other hand, very open.

>It's been mostly Apple's malevolent machinations that have prevented
>the "Mac OS box with common hardware" from coming about. View their refusal to
>allow Gateway to clone Mac hardware.

See my earlier message for Apple's (completely understandable) reasons for refusing Gateway. "Malevolent machinations" indeed!

If Apple was hell-bent, as you seem to think, on completely disallowing cloning, then why in the world did they give tremendous amounts of engineering assistance, and engineers, to Power Computing? (Power Computing is currently the largest Macintosh cloner; visit their Web site at http://www.powercc.com/ .) In order to allow Power Computing to start up well in advance of CHRP's advent, Apple has essentially allowed them to copy the first-generation NuBus and PCI PowerMacs.

>Supposing that I was a developer of an alternative OS (like Linux), and I
>approached Apple and Be seperately, who would give me register-level info
>willingly? Be, of course. Who would withhold information? Apple, of course.
>Until Apple is truly ready to make register-level calls available for
>developers, I view the CHRP hype by Apple as having as much validity as
>a Tramiel marketing promise.

Be could not possibly help giving you hardware info. As you so vociferously point out, they use CHRP (actually, the current developer BeBoxes don't - CHRP wasn't set in stone when they designed them). CHRP is an open standard; you can just go and download it. Whether Be would give you info or not is immaterial, since you can get it elsewhere.

>BTW: The first company to really get on the CHRP bandwagon is none other than
>Be, and Apple will have to change their strategy toward open systems to
>resemble Be, dropping the imperious, secretive nature of restricting
>development information.

What a jackass. Apple is pretty damn open - you can download their development documentation from their Web site for free. The only thing they won't tell you is how to use the hardware registers of recent Macs directly. Other than to support alternative operating systems like Linux,

can you think of any reason why they should?

Furthermore, Apple is one of the two companies (the other is IBM) that brought CHRP into _existence_. I don't know how you can paint them as imperious, secretive bastards when they're one of the major forces behind a standardized and open PowerPC platform.

brimiller@delphi.com wrote:
: >
: >To whom? To whom else would the Jaguar be worth anything, let alone $40
: >million? Where did you get that figure from anyway? Why would they want
:
: Not just Jaguar, but licenses and patents as well. The figure is based on
: approximate cost of development, potential licensing agreements that could
: be engaged in, net revenues from a properly marketed and supported Jaguar.
: Originally, the price would be much higher, since the only other method of
: gaining the Jaguar would be to buy controlling interest in Atari (which would
: cost between $30 and $50 million, depending on stock prices, and probably
: even higher, since when takeover bids start, prices expand dramatically. It
: also assumes that Tramiel would sell part of his holding, and if he would, it
: would be at a very high price.

Agreed. But keep in mind that by now Jaguar technolgoy could be
considered fairly standard, as the dozens of 64bit blitters for PCs
prove; if it is worth that much money than it is because of the already
available deleoment systems, games etc that willmake it more costly to
develop a new system from scratch.

: >How do yo get that price? How can you determine
: >what they are worth? Who knows how far this can go? I've read reports
: >that Atari may even own patents on concepts as basic as a scolling video
: >game screen. Maybe there's even more patent infringement litgation that
: >could generate untold revenue for Atari, maybe not. Unless they've sued
: >all they're going to, why would they sell, and for $30 million?
:
: Remember, this is not a "maximize value" concept, in which we wait over
: time to get the most revenue possible. This is strictly a "maximize my
: revenue _NOW_" from a major investor holding Atari stock's standpoint.
: Waiting for years for Atari to maximize revenue is foolishness. Incidentally,
: the selling price is less than the money value of Atari's current settlements
: and doesn't include future settlements. From a time-value of money standpoint,
: and this historical Atari screw-up factor, this is about the minimum price I
: would set at an auction (where the price could be bid up).
: ---

agreed.

: Also, $5 million would be generated probably by selling different rights to
: different parties (like selling VIDEL rights for $100,000 [a complete video
: subsystem for $100K is a steal]), etc.

The VIDEL system is not a steal. You alawys have to view the Atari
components in context with the competition. The VIDEl is by far inferior

to most graphic controlers in the PC market (such as the old ET 4000
chip)
It is much less of a steal as the operating system provides for hardware
independent graphic routines, so there is no need to bind the Atari VIDEl
chip with the Atari system. However, the DSP part of the Falcon could carry
some value and actually does, as the licensing to C-Lab shows.
The rest of the Atari hardware licenses do only carry profits as to
replacement parts production and repairs for existing machines.
The revival of TOS machines depends SOLELY on TOS; there are clones
available; the operating system is
being reprogrammed and supported by people different from Atari and is
sold well (Magic and shortly, MinT-NAES);
So continuing the computer line is much cheaper and better WO. Atari than
WITH Atari.
Conclusion: The rights to TOS and TOS hardware are by far not worth the
sum you are mentioning.

: Atari has name recognition that many other companies would _KILL_ for. The
: ATari name, worldwide, since its inception, has sold over $4.5 billion in
: products since the beginning. Atari still commands strong brand recognition.
: Again, this is an auction, and if the price is too high for SOMEONE to bid on
: (which I doubt), it could always be reduced at the end. The primary goal here
: is to get money for the shareholders, before Tramiels flush the value of the
: company completely down the toilet.
: ---

Absolutely agreed. The Atari brand will make most of the money, but I
doubt Tramiels will go so far; it seems they are in transition to
becoming a small game manufacturer for PC.

: >You must be a very wealthy investor, then? You seem to be full of good
: >advice. I don't mean to flamebait you, but what are your credentials in
: >this area?
:
: My financial status would not be an accurate reflection of this proposal
: (Tramiels are very wealthy, but are hardly barometers for wise business
: decisions). My point was that, if I were a major stockholder, I would sell
: the assets NOW, while they still have value. If the Jaguar fails and Atari
: goes bankrupt, the value of the company would be FAR less (just look at
: Commodore - it had market cap of $99 million before liquidation, yet sold for
: about $12
: million when all was said and done.)

Agreed. Only the numbers are (especially with the TOS computers) FAR too
high.

: As to my status, I am a student in the top 5% of my class at a certain business
: school ranked as the best business specialty school for 6 years (I'll let
: you research that latter remark since it captivates you so).

:-)
I thought that people in Boston are similar to the British, with an

inclination to understatement :-)
the rankings and reputation of my business school are also VERY acceptable.
:-)

Regards

Alfred

So it's only an open platform if you can get Linux for it? That makes no
sense. Apple provides all the documentation software or hardware designers
need -- all they don't provide is information needed for OS designers. Is
that a "closed" platform? Proprietary in some respects -- but closed?
As for Gateway, my understanding was not that Apple refused to allow Gateway
to clone Macs, but that Apple and Gateway couldn't agree to terms. Those are
two different things.

>Supposing that I was a developer of an alternative OS (like Linux), and I
>approached Apple and Be seperately, who would give me register-level info
>willingly? Be, of course. Who would withhold information? Apple, of course.
>Until Apple is truly ready to make register-level calls available for

Uh, they're not "register-level calls." Function calls have nothing to do
with what was being talked about. What was being talked about was the
documentation of the registers of Apple's custom chips -- documentation only
OS designers should need.

>developers, I view the CHRP hype by Apple as having as much validity as
>a Tramiel marketing promise.

Apple has clearly committed to CHRP. Isn't the fact that they've already
spent all that money designing it, developing documentation for it, revising
their OS for it (yes, System 7.5 for CHRP as well as Copland for CHRP are
both in the works) tell you that they are committed to it?

>BTW: The first company to really get on the CHRP bandwagon is none other than
>Be, and Apple will have to change their strategy toward open systems to
>resemble Be, dropping the imperious, secretive nature of restricting
>development information.

You really must be kidding. The first company to really get on the CHRP
bandwagon is Be? Are you serious? CHRP wouldn't *exist* if not for Apple!
CHRP was designed by both IBM *and* Apple! Get it -- *AND APPLE*. Read up
some more on CHRP (now called the PowerPC Platform) at http://chrp.apple.com/

Second of all, Apple does not restrict development information. The way
you have phrased your statment implies that Apple is restrictive about all
development information. They are not. If you want, you can buy the Inside
Macintosh series, or you get can get it *FOR FREE* in electronic form (and

it's exactly the same as the print version) by FTP'ing to Apple. Apple provides information on how to develop software for its operating system, and how to develop expansion cards and peripherals for all the slots and ports Apple supports. The only thing it doesn't do is release information on its custom chips, something only needed for people developing an OS. Your statement is a misrepresentation.

Why didn't Apple support Linux? Simply. The Linux people require that all versions of Linux -- source code included -- are available free to anyone who wants it. If Apple gave the Linux people all the low-level hardware and MacOS information, then Apple would also be forced to agree to release all that information for everyone to see. Apple doesn't want to release its proprietary information to the world, something which is understandable. With CHRP, all of this will be moot anyway. Not that it matters to most people. Real people buy applications, not operating systems.

It's a cool toy, if you can afford it. With the CAT box,
it makes a nice addition to multimedia work on the Falcon
with Expose. I don't think I can be considered a pirate for
grabbing images off VLM from music CD's, or can I? It dosen't
have the PlayStation's software, but then again, the Sony dosen't have
RGB, and to me that is an important feature. The Hacking on it's (JAGS)
hardware has already started, so if Atari gives up, I think you
will see more "Falcon-Jag" interfaces being developed (hacked).
That would be fine by me.

Mike

According to the stories I read, Apple's refusal of Gateway was a direct consequence of their supply problems - for the past several months they've really been hurting for a sufficient supply of the custom ASICs and PowerPC processors, resulting in $1 billion in backorders for their new PCI Macs. By the time Apple could get its suppliers to crank up production, CHRP would be here anyway - so Apple just told Gateway to wait until people started making CHRP boards. Gateway can then do clones without having to get any kind of engineering assistance from Apple at all - they need only buy CHRP boards, slap them in a case with sundry hardware, and license the MacOS.

: I think those days are over. Next year, the N64 and M2 maybe a must have.

I don't know about that. I think the whole industry is struggling
to regain it's former momentum. Nothing is selling as well as it used to.
The crash of '84 was caused by a glut of software. Perhaps a crash of '96
will be caused by a glut of hardware.

: Doom is available on the 3do. I like the 3do because of the computer feel in
: the titles.

That's why I bought the Jaguar. I don't own a PC at the moment
and I liked to option of buying Syndicate, Theme Park, Cannon Fodder and
other strategy games. The 15-button controller helps. Ever tried playing
a flight simulator on one of the older systems? I had "F-14 Tomcat" on my
7800 and man was that a pain to play. They tried to make too many options
possible on a limited controller and it got really, REALLY confusing.

And if that happened someone with half a brain would be able to re-write System 7.0 into a proper OS which was five times as fast and quite memory efficient !

I'm sure that's the main reason for not releasing the OS specs ...

I agree here ... especially when it comes to the Ultra 64. While Nintendo is known for excellent marketing and good games, they have never been innovative in terms of hardware. The NES wasn't the first console to feature computer quality graphics (the Atari 7800 was), the Gameboy debuted at the same CES as the Lynx ('nuff said), the Super NES came out two years later than the Genesis, yet in all that time they barely improved on the Genesis. Couple that with Nintendo's crappy business tactics which border on illegal and one wonders how people can be lauding everything that Nintendo does.

I never said Apple was "hell-bent on completely disallowing cloning."
Please don't attempt to put words in my mouth or make broad assumptions
about my philosophy (since you are greatly wrong in this case). I simply
stated that Apple's monopoly and tight-fistedness with hardware information
simply is not conducive with the attitude of a company "serious" about
open computing - and until their actions change, they will remain a
de facto closed system. Perhaps their actions will change - but I have no
evidence of current change at all. I never mentioned anything about my
perception of their attitude toward cloning. Stick to the issues.

Yep, you can - but can you get it about Macintosh? Linux developers couldn't.
The point is, Be would encourage these developments - all Apple is doing at
the present time is constraining or thwarting them.

I doubt that very much, when Minter came out with Colourspace for the
8-bit Atari, the ad said you can use it for video presentations. The
music is copyright, but not the images.

If you can hack it and add new products while the company no longer
supports it, than it's an Atari :)

I would rather see "STe-Jag" Interfaces as well. Wouldn't be cool if you
can use the ST to load and store Jag PD games? Heck, I would love to
interface VLM with Trip-A-Tron :)

Agreed, absolutely. I would say that's its more the game library,
the fact that the system is already developed, and that there are parties
working on developing titles for it.

>: Remember, this is not a "maximize value" concept, in which we wait over

>agreed.

Glad you do. :')

>The VIDEL system is not a steal. You alawys have to view the Atari
>components in context with the competition. The VIDEl is by far inferior

True, VIDEL isn't state of the art, but it's a fully-integrated video
susbsystem that provides decent-quality output. I'd say it would fetch
some money (certainly more than Atari's making with it now).

>So continuing the computer line is much cheaper and better WO. Atari than
>WITH Atari.

Also agreed - however, selling "official rights" to the OS, etc. would
eliminate certain "legal uncertainties" about look and feel, etc. and also
give the owner a degree of power over the TOS market (and repeat buyers),
as he would have the rights to the OS that a majority of them use.

>Absolutely agreed. The Atari brand will make most of the money, but I
>doubt Tramiels will go so far; it seems they are in transition to
>becoming a small game manufacturer for PC.

I don't think that Atari's creditors will allow it to shrink much more -
I believe they borrowed money using recallable bond issues around 1992
(when they decided to cease trying to make it in computers to save money,
and in the end, lost far more than they "saved"). This would mean that
in the event of too much shrinkage, Atari's debt (or a large portion
thereof) would be called in. This would be enough to kill the company,
certainly what's left of "shareholder value."

>Agreed. Only the numbers are (especially with the TOS computers) FAR too
>high.

That's why I used the "auction method" - if they were too high (which they may be), at the end of the auction, items not bid on could be reduced until they are sold. However, a sale such as this would probably still generate more value for shareholders than a shriveled Atari Corp., constantly downsizing, with negative cash flow and heavy losses, trying to make it in videogames and computer gaming, where its competitors are at least ten times its size.

>:-)
>I thought that people in Boston are similar to the British, with an
>inclination to understatement :-)

Hey, we're the ones that kicked the Brits out, in Concord, Mass, so we can't be too similar, can we? ;') I simply included that comment to refute the sarcastic suggestion that one need be wealthy to evaluate maximization of shareholder value.

>the rankings and reputation of my business school are also VERY acceptable.
>:-)

I go Babson (sorry, James, if you already figured that out). Where do you go?

I must say I am anxiously awaiting Mr. Woods' proposal to maximize shareholder value at Atari Corp. in the short run.

>Medusa. Sounds powerful and to be respected.

Me too. Appealing names mostly have a ring of power to it - you
achieve that simpler with a slightly negative bias. A computer called
`Hercules' or `Zeus' even has a bit of an old-fashioned ring to it.
Cf video cards: `Stealth', `Viper' etc.

Would you rather have a 64 bit home entertainment system called
`Kitten'? :-)

P.S. I really think some chip names are badly chosen. The most
powerful microprocessor on earth is ATM some Alpha called 21164/blabla
(See? Forgot the name already). And though PPC sounds OK, the code
numbers 601 and 603 do _not_. They sound like Peugeut car names :-)

PISCHKE DAVID <pischke@ecf.toronto.edu> writes:

>So it's only an open platform if you can get Linux for it? That makes no

No, but any platform for which it is impossible to program an alternate
OS for due to refusal of the manufacturer to disclose register-level
information can hardly be called "an open platform," can it? Lack of
Linux is more of a symptom than a barometer of the problem.

>documentation of the registers of Apple's custom chips -- documentation only
>OS designers should need.

"Should" is a very judgmental term. If Apple (or any computer manufacturer)
subjectively withholds critical information about sections of their computing
hardware because developers only "need" to know certain things, and "shouldn't"
know other things, it can hardly call itself "an open platform." Does Be
withhold information selectively in order to maintain an OS monopoly on its
machine? Wouldn't Apple _BENEFIT_ greatly if the Mac were a truly open
platform, instead of the closed-ended one it is today, with OS choices
only available from Apple?

>Apple has clearly committed to CHRP. Isn't the fact that they've already
>spent all that money designing it, developing documentation for it, revising
>their OS for it (yes, System 7.5 for CHRP as well as Copland for CHRP are
>both in the works) tell you that they are committed to it?

Note that the money spent was primarily aimed to allow Apple to shore up its
fading MacOS software, which has become bloated or inefficient. If Apple was
truly committed to an open platform, it would be inviting SCO, Sun, Be, Linux,
NeXT, and many other OS developers to port their OS to Mac CHRP. Instead, Apple
wishes to maintain a monopoly on OS's, and maintain a say on who "may or may
not" develop OS software for Macintosh, and who "should or shouldn't" have
information on certain chips. By trying to control its userbase, Apple
alienates users who WANT to run less-common OSes. Now, for the Linux-exclusive
user, a Falcon030 is a far more viable Linux platform than a PPC-equipped
Macintosh, all because of Apple's heavy-handedness.

>You really must be kidding. The first company to really get on the CHRP
>bandwagon is Be? Are you serious? CHRP wouldn't *exist* if not for Apple!

So Apple developed CHRP. That's very well and good, but the only firm I
see taking the concept and running with it is Be. Apple right now is
primarily using the PPC/CHRP architecture as a springboard to shore up the
bloated, slow MacOS - not as a revolutionary platform to give its users more

choice in OSes and hardware. Tell me that I am wrong, not based on what
Apple _SAYS_, but on what is _DOES_.

>it's exactly the same as the print version) by FTP'ing to Apple. Apple
>provides information on how to develop software for its operating system, and

^^^^^^^^^^^^^^^^^^^

That's Apple's problem. How can they call Macintosh an "open system" when
register-level calls aren't available, and developers are restricted to
programming under a single, proprietary OS on the Mac, dominated by the
company that makes the hardware? Again, Apple is enforcing a monopoly, and
shooting itself in the foot in the process. Even if MacOS became unviable,
if Apple had a truly open system, Macs would sell, because a user could
buy one to run another OS, like Solaris. Look at the availablity of
OSes in the PC and even Atari platforms. Look at the dearth of them in
the Apple camp.

>Why didn't Apple support Linux? Simply. The Linux people require that all
>versions of Linux -- source code included -- are available free to anyone

And what is wrong with this?

>who wants it. If Apple gave the Linux people all the low-level hardware
>and MacOS information, then Apple would also be forced to agree to release
>all that information for everyone to see. Apple doesn't want to release

A weak excuse, to be sure. If Apple called up the Linux people and said "we
will provide you with register-level information, provided that your license
to use it includes a provision not to release it to anyone else," Linux would
be on Mac in a matter of months.
-
Secondly, what is wrong with releasing Mac hardware registers to the public?
Even Commodore made the AGA registers available. The result of making the
ation would be other OSes coming onto the Mac platform - making it open.
If Apple is truly committed to open systems, why worry? Because Apple is
supporting CHRP so that MacOS will sell on _OTHER_ platforms, not so that
Mac becomes an open system.

>With CHRP, all of this will be moot anyway. Not that it matters to most
>people. Real people buy applications, not operating systems.

An OS is an application in a sense, providing the user with the "look and
feel" (and applications) that he wants. Most people want a system without
limitations, restrictions, etc. imposed by the manufacturer on development.
Until Apple changes its tune (through actions, not words), it will remain
a closed, minority platform. It really is that simple.

Thank you for allowing me to win the argument by insulting me. :')
--
Again, your point is moot - I'm not talking about developing WITHIN MacOS,
I am talking about developing other OSes, and programs external to the MacOS.
That's all I've talked about, that's all I EVER was talking about.

I think it's interesting that the most vociferous foes of TOS seem to defend
Apple as the last bastion of truth and justice when a simple, factual
observation about Apple's past practices puts the hallowed firm in a
negative light. To think that I actually angered someone enough to
insult me simply by noting Apple's efforts to prevent alternate OS development
on the Macintosh is truly amusing!

Thanks for a good laugh,

You've hit the nail on the head. Apple is interested in CHRP only as a
vehicle to sell MacOS, not as a vehicle to allow Mac users to use other OS's.
If it were, Apple would be an open company _right now_, and Linux would be
available to the general public using Macintoshes.

Wanted: SoftWare to write Web Pages and HTML on an Atari ST/TT. I'm
not looking for a Simple Editor like Everest. I'd like something that would go
through all the steps so even a Dummy like me can make a good web page using
HTML. I heard such software like this exists for the TT030. I think it's from
Canada. I may be able to use such software.

Whatever I get, I'd like P.D., ShareWare or something I can try before
I buy. Hopefully, no CrippleWare.

Could someone please reply. Please tell me where I can get such
software or if I can get it from you.

Please Direct all Replies to E-Mail as I
Often do not Read NewsGroups. So if you
want me to read it, Send E-Mail to:

The POINT was that Apple went way out of its way to get a clone company healthy, since CHRP wasn't ready a year ago when Power Computing came into existence.

>>is an open standard; you can just go and download it. Whether Be would

>the present time is constraining or thwarting them.

I doubt very much that Apple's policy has anything to do with wanting to specifically disallow the writing of other operating systems (i.e. "thwarting"). Ever since the Quadra was released, Apple has been releasing fewer and fewer details about the inner workings of their computers - it's been going on for a lot longer than Linux has. Personally, I think they're trying to discourage developers of Mac software from writing to hardware registers. That's caused many application compatability problems in the past. Regardless, they have a blanket policy: do not release HW register info for Quadras and PowerMacs. And because of the nature of Apple's bureaucracy, it's unlikely that a freeware organization can convince them to cough up the info. (If there's one thing Apple has a big problem with, it's too much bureaucracy and management.)

Another related reason is the League for Programming Freedom (LPF)'s
boycott of Apple, and the Free Software Foundation (FSF)'s support for
said boycott. This has led the FSF to discourage porting of its soft-
ware to Apple platforms, so any version of (say) Emacs or the GNU
utilities you could run on you Linuxed Mac would technically be, um,
scabware.

Nothing. An admirable notion in todays "Take The Punters For Every Penny
They Have" market (Selling bugfixes, selling pre-release betas, selling
support, selling [your soul]...)

I doubt that.

I believe that Linux is released under the Gnu Public License - meaning
all sources area available to everyone, and that you must not withhold
anything if asked for it.

To live up to the GPL, one must break Apple's licensing conditions. To
live up to Apple's licensing terms, one must break the GPL. It is this
deadlock which prevents Linux porting to the Mac.

There may be other reasons, but I believe this is the biggie.

Old news: the boycott was lifted over a year ago. FSF treats MacOS
just like any other proprietary OS (like Solaris).

>some money (certainly more than Atari's making with it now).

VIDEL doesn't hold a candle to the current ultra-cheap SVGA chipsets,
which offer high integration and low cost. For example, it's possible to
make a very cheap accelerated VLB or PCI video card with a single video
controller chip, a single video DAC chip (sometimes the DAC and controller
are integrated), and some DRAM or VRAM for a frame buffer. Nobody will
buy the unaccelerated low-res VIDEL when they could buy a much more
capable S3 chipset cheaper.

VIDEL is a classic example of Atari's bungling - had Atari released the
Falcon on time, the VIDEL chip would have given the Falcon much better
graphics capability than the vast majority of PCs then being sold. But
Atari sat on its hands, and let the world pass VIDEL (and the Falcon) by.

So? What does it matter what Apple is interested in? Why should Apple be interested in selling competitors' operating systems? Just like every other computer manufacturer, they're in this to make money! In any case, it's irrelevant why Apple is interested in CHRP. The fact it that once CHRP machines come out, users will be able to choose the OS they want.

Why can't it be called open? Apple provides all the documentation anyone
needs to develop any hardware or software they might want -- *except* for
operating systems.

>>documentation of the registers of Apple's custom chips -- documentation only
>>OS designers should need.
>
>"Should" is a very judgmental term. If Apple (or any computer manufacturer)
>subjectively withholds critical information about sections of their computing

No, "should" is not a very judgemental term. The fact is that application
and card designers don't need documentation on Apple's custom chips. Period.
Only OS designers have any need for this information. How can you say that
there is any judgement going on?

> Does Be
>withhold information selectively in order to maintain an OS monopoly on its
>machine?

This statement makes no sense. If Be is developing a CHRP machine, they
can't withhold information, because the CHRP specification is *public*.
By definition, there can be no OS monopoly on a CHRP machine.

>Note that the money spent was primarily aimed to allow Apple to shore up its
>fading MacOS software, which has become bloated or inefficient. If Apple was
>truly committed to an open platform, it would be inviting SCO, Sun, Be, Linux,
>NeXT, and many other OS developers to port their OS to Mac CHRP.

You don't understand. CHRP is not "Mac." Anyone who wants to write an
operating for CHRP can write it *now*. The documentation required is public.
You can read it yourself at http://chrp.apple.com/"

>So Apple developed CHRP. That's very well and good, but the only firm I

>bloated, slow MacOS - not as a revolutionary platform to give its users more
>choice in OSes and hardware. Tell me that I am wrong, not based on what
>Apple _SAYS_, but on what is _DOES_.

Of course Apple wants to sell more copies of MacOS. Any business will want to sell its own products! You seem to be missing the fact that CHRP is totally open. All the documentation is available. If you wanted to, you could start writing your own operating system right now. Nobody has to ask Apple anything. CHRP is out there. As for "the only firm taking the concept and runnning with it" being Be, that makes no sense. Be wouldn't have a concept to run with if not for Apple. How can you say "So, Apple developed CHRP. But they are not intersted in a new, open platform."

>>Why didn't Apple support Linux? Simply. The Linux people require that all
>>versions of Linux -- source code included -- are available free to anyone
>

So Apple calls up the Linux people, and they refuse to agree to Apple's condition. Then what?

>Secondly, what is wrong with releasing Mac hardware registers to the public?
>Even Commodore made the AGA registers available. The result of making the
>ation would be other OSes coming onto the Mac platform - making it open.
>If Apple is truly committed to open systems, why worry? Because Apple is
>supporting CHRP so that MacOS will sell on _OTHER_ platforms, not so that
>Mac becomes an open system.

To quote you, "And what is wrong with this?"

Maybe Apple is supporting CHRP for two reasons: (1) It wants to sell more MacOS and (2) it realises that users want a choice in operating systems. You make it sound like Apple is some evil company that wants to keep everything to itself, and all these other companies do things out of the goodness of their hearts. The fact is that all these companies you mention do things only because they increase profits.

At this point, the whole Linux debate is moot. CHRP is out and CHRP machines and operating systems will be out on the market in force next year.

They would have sold at least one more PowerMac if MacLinux existed. :-)

I might check out the BeBox now, instead. Now _there's_ a company
that truly supports developers. (Not that Atari is one, oh no...)

Regards,

Probably true..If Apple can get the pippin out, than they can sell it as a web engine plus entertainment. The price has to be right at under $500. But there will always be demand for a high powered dedicated game console.

>Wouldn't Apple _BENEFIT_ greatly if the Mac were a truly open
>platform, instead of the closed-ended one it is today, with OS choices
>only available from Apple?

Actually, there are other OS choices on Macs. There is, for instance, a version of FreeBSD that runs on most Mac II-class machines. It is only since the advent of the Quadras that Apple has begun to be tight-lipped about hardware register info; the people who wrote FreeBSD . There is also a Mach-kernel OS called MachTen that runs on the Mac II series, Quadras, and PowerMacs.

What's the difference between MachTen and Linux? Likely two things: Money and confidentiality. The company that makes MachTen won't show you their source. They probably signed an agreement with Apple to not release the hardware register info they got. Linux, since it's distributed under the copyleft, must make all its source available for free.

Would Apple benefit? I doubt if they'd see huge sales increases, which is what they're after. The current Mac hardware is a poor vehicle for running operating systems other than the Mac OS, since it lacks industry standard I/O. It'd be hard to attract ports of commercially significant operating systems. (Linux is very cool but is not a way to get lots of sales - it's a hobbyist OS only. MachTen is for people who absolutely must run a stable, feature-complete UNIX on a Mac.)

>Note that the money spent was primarily aimed to allow Apple to shore up its
>fading MacOS software, which has become bloated or inefficient.

What?! Where'd you pull THAT one from? In what way will moving to CHRP do anything, pro or con, for the MacOS (aside from the question of whether it's bloated, inefficient, or fading)? It'll still be much the same code - just adapted to use CHRP hardware instead of Mac.

>If Apple was
>truly committed to an open platform, it would be inviting SCO, Sun, Be, Linux,
>NeXT, and many other OS developers to port their OS to Mac CHRP.

Uh... Apple doesn't have to invite them. They can just go out and grab the CHRP specs, buy a few boxes (Apple-built or not), and write the code. No licensing is required.

>>You really must be kidding. The first company to really get on the CHRP
>>bandwagon is Be? Are you serious? CHRP wouldn't *exist* if not for Apple!
>
>So Apple developed CHRP. That's very well and good, but the only firm I

>see taking the concept and running with it is Be.

Be is running with it about as fast as Apple is. The main difference is that you can see Be's prototype / development machines right now; Apple's prototypes aren't for public consumption. The only reason Be's are is that Be needs to have developers working on software _today_, not tomorrow, and they need lots of publicity. (BTW, you can't buy a BeBox right now unless you are a developer and show some kind of serious intent to write software for it. Also, the machines they're making right now are not CHRP compliant - it was only very recently that the standard was finished and made public, so there was no way for Be to do anything but make their hardware sorta-but-not-quite CHRP.)

Apple probably has CHRP prototypes in the hands of some developers, but it's undoubtedly low-key, like any of their past developer seedings.

>Apple right now is
>primarily using the PPC/CHRP architecture as a springboard to shore up the
>bloated, slow MacOS - not as a revolutionary platform to give its users more
>choice in OSes and hardware. Tell me that I am wrong, not based on what
>Apple _SAYS_, but on what is _DOES_.

I'll tell you that you're wrong solely because you're way out in left field with this argument. As I said above, what in the world does the shift to CHRP do to solve the problems you perceive with the MacOS? Even from your viewpoint, it doesn't make sense.

>That's Apple's problem. How can they call Macintosh an "open system" when
>register-level calls aren't available,

Pedant point: there is no such thing as a "register-level call". A call refers to calling a software subroutine. Hardware registers refer to memory-mapped registers that control peripheral hardware (like video, SCSI, etc.). When you use hardware registers, you don't call them, you read from and write to them.

>Secondly, what is wrong with releasing Mac hardware registers to the public?
>Even Commodore made the AGA registers available.

Apple probably wants to avoid having to go through as many applications compatability problems as possible. (This is of course speculation, based on the fact that there have been such problems for Apple in the past.)

No, you were talking about developing for Macintosh. Macintosh != MacOS.
Macintosh is the Macintosh hardware *plus* MacOS -- the hardware-software
system that works together.

>I think it's interesting that the most vociferous foes of TOS seem to defend

In two years, "Macintosh" will not exist as we know it today. Apple will
manufacture CHRP machines. How can you claim that Apple is constraining or
thwarting when they *developed* CHRP. The way I see it, Be is just like
any other company riding on Apple's CHRP coat-tails.

En route to Southern California, Peter Sinclair, a University of
Northern Iowa student, was waylaid by Atari seperatists. His badly
mangled body was found on the side of the highway, and a "fuji" was found
tape to his buttocks.
The motive behind this vicious attack is linked to Mr. Sinclair's
anti-Atari activities. It is believed Mr. Sinclair was on his way to
deliver a speech towards his followers at a propaganda rally in Southern
California. It was also mentioned his speech was to call to arms all
Macintosh and 3dO owners to obliterate the Atari seperatists.
With the loss of thier great leader, the anti-Atari movement has
suffered a crippling blow.

I used some pretty funny tenses in my article because I was pretty sure the boycott had been lifted, but I couldn't get through to www.lpf.org to check. (I still can't). The story still serves to illustrate the philosophical gulf between the Linux and Mac ways-of-life.

> powerful microprocessor on earth is ATM some Alpha called 21164/blabla

(I believe the latest and fastest is the 21164/300 [300Mhz 21164 CPU]. Or at least it was about 6 months ago when I last looked. Current talk is that they will ramp that up to 600Mhz in the next 18-24 months.)

True. But for those of us in the software industry [and possibly the hardware industry as well], the name "Alpha" has a ring of "first attempt, badly buggy, poor performance, bloated beyond belief". All negative.

(BTW, those of you who frequent the PC newsgroups, the name "Microsoft" may have popped into your mind when reading that expansion of the meaning of "Alpha". It's a common enough comment to read there)

And in todays market, names mean more than product specs. Especially when Joe Consumer goes to buy a product. Frequently, the customer will ask for a _type_ of item they want, and then make the decision of the basis of the look of the box, the name of the product, or the salesmans spiel.

The market itself is populated with large numbers of people wanting to buy products without knowing what the product does, and with sales people who (often) know even less than the buyers.

Thankfully, the Atari users that I have met do not fit this scenario.

The (dull, boring, unimaginitive) named products often do more than the (bright, alive, inspiring) named ones. But sell less. Would you have bought an Atari Sparrow? I dont think so - it is a rather anaemic, limp and rather weak sounding name. That is why they changed it to Falcon.

I don't believe that GNU would have to break Apples licence agreement.
The GNU licence says that the source code for Linux must be free for all,
not the Apple specs. I am very hopeful for a Linux release for Power
Macs. What could be better than running my two favorite OS's on my one
PowerPC.

I know one thing, I've never seen one here in Canada. The first I
heard of it was here on the internet. Surprises the heck out of me
that its been out for two years! I used to be be a big 8-bit fan
(still am I guess, just juiced it up again). I would have been more
than interested in a game system by Atari. I'd been contemplating
buying a SNES, Sega, etc., but had never even heard Atari had the Jag
out. There certainly hasn't been any marketing here in Canada.
Haven't even seen it in Wal-Mart.

3413. Saw Jaguar paid TV ad

Newsgroup: comp.sys.atari.advocacy
Date: 1995-12-16 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.951216104643.23243A-100000@PEAK.ORG>
Source record: 10668

Early this Saturday morning, I was channel surfing for Looney Tunes when I saw a Jaguar on the TV. Turns out it was paid TV by Atari for direct marketing of the Jaguar. For $199, the package came with a Jag, 2 controllers, and 4 games. I think the games were Kasumi Ninja, Cybermorph, Tempest 2000, and _damn_ I can't remember the 4th.

I was surprised. The whole thing was almost ridiculously juvenile, but so is "Nintendo TV" which you see at the Nintendo booths in department stores. It was a lengthy presentation. They did a good job of showing many of the games available for the Jag and indeed I am glad to see there is a whole shelf of Jag games now at most stores which carry the Jag. Most curious was screen shots from "Missile Command 3-D" and "Fight for Life" and others. It appears these are just around the corner.

I'm going Xmas shopping today - going to check out pricing locally on the a Jag for myself. Seems like the Atari direct deal is a buy. However, there's an electronic superstore with a returned Jag (sans box and manuals) at a Markdown. Was in there looking at it the other day where the lonely unit was like an animal forelorned at the pound. I wonder if I could get a manual and warranty from Atari for it?

Has anyone played Rayman or Super Burnout on the Jag? They look like good games. Also: What happened to the "Catbox" deal? Is it still available? Is it necessary to link to another Jag? Is there really a Jag modem?

James

>will always be demand for a high powered dedicated game console.

A Pippin-style system, if marketed, could sell in fabulously huge quantities,
and give the maker control over many Internet connection suppliers and trends.

Commodore's CDTV was a (crude) first attempt at this, the CD32 was nary
better, but in their time, they were revolutionary (and are probably
capable of providing net access).

Perhaps an investor could buy the TOS technology (including VIDEL :')) from
Atari, bundle it into a cheap, tiny box, provide web software and some games,
and do it all for under $400. They could make a fortune.

Why hasn't Apple already committed to doing this, and started the process?
If Apple was truly interested in opening up the Macintosh, it would grab
these "accounts" before Intel got them. Apple certainly isn't the only
game in town, and as a small piece of overall marketshare, it's fighting
an uphill battle. If it were interested, we'd see a bit more action toward
this end.

>Be is running with it about as fast as Apple is. The main difference is
>that you can see Be's prototype / development machines right now; Apple's
>prototypes aren't for public consumption. The only reason Be's are is
>that Be needs to have developers working on software _today_, not
>tomorrow, and they need lots of publicity. (BTW, you can't buy a BeBox

I agree about Be's need for publicity. however, Apple's secrecy and "inner
sanctum" philosophy reminds me of Atari's old methods, restricting developer
access to prototypes until they were released, albeit with a dearth of software.
Be is taking the actions necessary as a minority player to grab and hold
marketshare, mainly at the expense of Intel. Apple is making no such effort
to attract developers, acting coy and arrogant. If Apple is devoted to open
systems, why not usurp the competition and release them (or at least developer
prototypes) NOW? Because Apple views CHRP as a way to sell MacOS to others,
not as a way to bring other OSes onto Mac.

If that's Apple's goal, than why not simply say "Apple isn't interested in
open systems, but merely in selling MacOS to other open systems." Then,
we wouldn't have this argument. I think you're trying to sit on both
sides of the fence right now. And I don't believe selling MacOS to other
platforms is an incredible way for Apple to make money.

>no less.

How? I simply hypothesized that Apple's control over this information restricted alternative OS development (and limited the user's choices). If Apple was "dedicated to open platforms," these restrictions would not exist. Thus, Apple MUST have motives for withholding this information. If not, perhaps you can enlighten me as to why they withold it - for pleasure, perhaps?

>other companies, does things because they want to make a profit, no more,
>no less.

This is the fourth time that I've seen it suggested that I want Apple to enter into business agreements that will destroy it and make its profits disappear. Au contraire, I am simply asking for honesty from Apple - either open up the Mac, or admit it is closed and that its strategy is primarily to sell OSes on other platforms. You've got to do more than talk the talk, you've got to walk the walk.

Sure it does. It means that you ran out of factual arguments and inserted
a red herring into the argument in an attempt to cover your floundering
hypothesis. If I say I call 'em like I see 'em - you're incorrect, have
I just won the argument? Insults are something for juveniles, not people
discussing a prevailing issue.

>I also hate it when people bash Apple for things they really aren't guilty
>of, or imply that Apple is being horrible and stifling because they don't

I simply noted that the Macintosh is not an open platform. With proprietary
hardware information under wraps, Apple maintains a powerful monopoly on
info that allows them to guide development as they wish. Where I started
opining was when I stated that this isn't helping Apple or the Macintosh. I
have yet to see an effective argument stating that it is.

>Why hasn't Apple already committed to doing this, and started the process?

You seem to miss the point. Apple *HAS* already done this. CHRP specs are already public. They are out there! You can buy the book, which is in print and should be on bookstore shelves now, or you can look at it free on the web at http://chrp.apple.com/. Anyone can go out RIGHT NOW and start building a CHRP machine and writing a CHRP-compliant OS. Why can't you understand this. Do you think we're lying or something?

>I agree about Be's need for publicity. however, Apple's secrecy and "inner
>sanctum" philosophy reminds me of Atari's old methods, restricting developer

First of all, Apple has no need to attract software developers, at least for its own OS, since CHRP MacOS will be compatible with the current MacOS. As for new operating systems, there are already several companies out there committed to porting their products to CHRP. And you have no way of knowing how many other manufacturers Apple is trying to court. Just because the details aren't public doesn't mean Apple isn't trying to attract hardware and OS developers.

If Apple really wanted to sell MacOS to others, they could have simply ported MacOS to other machines for a lot less money than they've spent on CHRP.

With the PSX and Saturn out and selling, and the Nintendo 64-bit machine due along with the M2 sometime next year, Atari's chances of shitfting large numbers of Jaguars _this_ Xmas would look to be very, very, slim. Lets face it, if they couldn't make the Jaguar a sucess when it only had the SNES and Genesis/Megadrive as competition, what on earth makes you think its going to be a winner when the PSX and Saturn are actually out with better games?

Under current management, you're right. However, a $99 Jaguar could
fare excellently if properly marketed.

Atari's biggest problem is its lack of understanding of industries it
"competes" in. I simply designs fantastic hardware, prices it cheaply,
and expects millions of people to buy it (despite the fact that it is
in the back shelf at the far corner of the games store.

Really, what Atari needs to do is to begin doing what other companies
interested in primary shelf space do - buy shelf space. When people
enter stores, seeing Saturn and Sony stuff in the front, they naturally
assume that these are big-selling systems. When (if) they see the tiny
Atari display, they think "niche box without any titles." Atari needs
that SHELF SPACE to grab impulse buyers more than anything right now,
and Tramiels would be unwilling to buy it.

Ever since Atari dropped computers, it's been too small and had too much
of a negative cash flow to be able to compete in this fashion. Guess the
chips have fallen.

I always wanted a system called "The Master`". where the system was advertised by bulky hairy men in leather or bearded maniacs laughing over the corpses of Tom Baker, Peter Davison and Sylvester McCoy with the line "Some Masters Are More Sinister Than Others"

I can see why it would put some people off, though.

High All !

I have a big problem with that programms on my FALCON !
It realy goin on my nervs .-(((

I realy get often a massage like this :

RUNTIME ERROR 162 (-165) IN ADRESS .....

I wrote all you programmers, but nobody answer.

So Please leave just only a little massage to me, if you
recognize this massage and the problem too.

I have an IP account for 35,- German Marks and i pay it
all month, but i couldn't use it very much, because CAB
dosen't work ! So Please Please Please Please (no i'm not
ripping off my cloth) do something !!!

Ciao

The Twin Galaxies Intergalactic Scoreboard is "the Official Scoreboard for the World of Videogame and Pinball Playing."

Since 1982, Twin Galaxies has been compiling scores and organizing contests which have appeared on national shows like ABC-TV's "That's Incredible" and "Entertainment Tonight."

Twin Galaxies' high-score charts were carried by the Guinness Book of World Records in the 1984, 1985, and 1986 editions.

During each of many years since 1982, Twin Galaxies has hosted two major contests: "The Videogame Masters Tournament" is a high-score contest on hundreds of current and classic games; The "North American Videogame Challenge" is an invitation only "player-of-the-year" contest featuring competition between hand-picked players. To be considered as a contestant you must register your scores with Twin Galaxies.

Many magazines, newspapers and news services regularly ask for our high-score charts in order to publish the top scores achieved on today's hottest games. To be included in these top score lists you must register your scores with Twin Galaxies.

To submit your scores on arcade or homegames, fill out the following information and send to:
Twin Galaxies
P.O. Box 1556
Fairfield, Iowa 52556
(515) 472-3882

Player Information: Name, address, birthdate, today's date

Game Information: Name of Game, Name of Arcade, (except if homegame)

e-mail address

All score submissions must include photograph of final screen showing score. Three witnesses must sign the submission verifying that they saw you achieve the score. Also, the attendant of the arcade location must sign, too. These four signatures are imperative for the score to be accepted.

Our Twin Galaxies Web site is now under construction! It will enable you to obtain up-to-date high score charts for any game. Be sure to send us your e-mail address so that we may notify you when the site is up and running! E-mail to walter_day@fcsmtp.mum.edu.

If you would like to be a correspondent for the scoreboard and function as an official witness for high-score attempts in your area, contact Walter Day at Twin Galaxies (515) 472-3882.

> OK, Peter:

Montclair Mall (mojor mall in the Inland Empire) has Jags at the Babbages there. Also, in Montclair, The Good Guys also carry the Jag (they are located in an adjacent shopping center). Ontario, a pretty good sized city (where I live now, BTW), doesn't have a major mall right now, but in the neighboring city, Rancho Cucamonga, they have Jags at The Warehouse.

They are building a "Mills" mall here in Ontario, they are huge, and will probably have a Software Etc., the Gurney Mills mall north of Chicago has one.

So, what you have done here, is effectively show an area that has relatively few video game stores, and show it as having no Jag coverage. So here, both you logic, and your facts, are wrong.

Keith.

: I go on a badly needed R&R and I comback to a near empty area.

Ahh ... Sinpop! We missed you around here (NOT). Did you get
assaulted by anyone while in California?

: Will the Jag be pulled into heaven by Atari?

Not suddenly. Atari has a tendency to slowly pull out. I
personally think it's smart for Atari to look for another source of
income.

: Does 3do and Sony rule?

Sony sold 500K units as of last X-Mas. They originally targeted 700K. The
PSX is certainly doing well, but looks to me like to whole industry is in
trouble. The Goldstar 3DO sold well, the Panasonic one did not. The
Jaguar also (surpisingly) sold quite well at many stores. The new $99
list price and a library of close to 50 games put it in a better state
than it was in last X-Mas (17 games and a list price of $160).

Aw c'mon Peter! Any Jag basher that can hold his water knows that you
have to look in the very back of a Babbages (hidden under a rug or
something) to find the Jaguar section! Those geniuses still haven't
figured out that if you hide something (and as an ace in the hole
claim that the Jag "sucks" in case any customer is lucky enough to
stumble across their "display") it probably won't set many sales
records. Duh! I just love hammering on salesdroids that feed me the
"Jaguar doesn't sell at all!" line. What a frigging joke!
Curtis J.

Hey Sinplop! You want a new thread, I'll start one here.

Did you see the recent January issue of Computer Shopper? They have a very nice article titled "Apple gets Bitten". The article states that the future of the Mac is in doubt with it's marketshare falling from 15% to less than 8% in just the last 14 months alone!

It also talks about how the company is suffering from mismanagement of supplies and that it's move to lisence the hardware to other manufacturers is too little, too late. They see the trend in declining marketshare continuing. Will the Mac be in the same place as the ST? Perhaps!

Ha! And you bash Atari while the object of your own fantasies goes down the tubes?!

You're a real wonder, Sinflop. I never hated Apple before. In fact, I enjoyed using Macs. But nowadays, I laugh at every problem Apple faces. People who ask me for recommendations on buying PCs nowadays and I tell them to stay away from Macs.

And it's all because of you, Peter! See what you have done? Your fanaticism is hurting the very company you support!

Hilarious!

/Kevin

```
: I have been playing FIFA and ShockWave. I came upon a Jag brochure, the titles
: shown looked like 8-16 bit ish..

Yeah ... name the games. Letsee your 8-bit NES pull off Doom,
Iron Soldier, Aliens Vs. Predator, Highlander, Dragon's Lair,
Hoverstrike, Rayman, PowerDrive Rally, Pinball Fantasies or any others.
Most of the alleged "16-bit looking games" actually look better than their 16-bit
counterparts. A few games could be duplicated pixel for pixel on the
16-bitters, but most could not.

There are 75 employees at Atari's operations internationally - the same number was the number of ENGINEERS that Atari had as late as 1993. Key employees have been fired or quit, and little if any internal engineering knowhow remains (the departure of Bill Rehbock is a particular example of this).

>#2 - Falling stock
>------------------
>What gives?

Sales of the Jaguar are not great, losses are high, cash flow is negative. Investors are viewing Atari as a poor investment because of these factors. Atari's decision to convert itself from an international multi-product corporation, with name brand recognition and sales offices across the Americas and Europe, with 1200 employees, a well-selling computer line, #1 market share in the UK and Germany into a company with less than 100 employees, sales offices in only two countries, oriented around a single product hasn't paid off.

>#4 - Babbages is dropping the Jag
>---------------------------------
>I heard that when current stock clears, there'll be no more. Substance
>to this arguement?

Don't know, but I wouldn't doubt it - Atari is too far gone to rescue the Jaguar, and has no products to fall back on (hence the announcement that Atari may be entering PC games - Atari probably is trying to convince customers and investors that it can stay afloat repackaging and selling other companies' games on the PC).

>-----------------------
>Negative Jag press is nothing new, but I read in one of the Anti-Atari
>rags that Atari is becoming a software-only company and that the PC will
>be the primary platform they support.

Who knows? Can't trust those magazines, but how many of we old Atarians can trust what Atari says either?

>#6 - $99 price to clear remaining stocks of Jags
>---
>This could be complete hogwash, or it could be true. True, the SNES and

Sure seems to be shades of the Falcon here - "No, we really do mean to support it." While Atari coyly told the investment community that it was exiting the computer market, the message it gave its dealers, distributors, developers, and users was completely different. Of course, when Atari was selling Falcons, sales per quarter were in the $10 - $20 million range, and after the first quarter of '94, when Falcons first hit the US market, Atari posted $10 million in sales, with a $1 million loss. They'd love to be able to quote numbers that good today.

By screwing their userbase, they abandoned folks who kept them afloat through bad times. This is why Atari isn't miraculously avoiding going down the drain like it used to - without engineers or any of the folks who used to be Atari's reps to its userbase, Atari is just a discount manufacturing operation with poor financial results.

Apple's collapse will make room for newer computer makers devoted to open systems. Microsoft's recent Java calamities and rout over errors in Windows '95 (and sales well below expectations) continue to boost my contention that systems will diversify, not consolidate on a single OS, and that multiple file formats will condense into universal ones (so that your boss at work, where you telecommute to, doesn't care whether your work is done on a Medusa, TT, Falcon, Mac, Amiga, Draco, BeBox, or system yet to be invented and marketed).

Message-ID: <Pine.SUN.3.91.960104075223.14945A-100000@PEAK.ORG>
Source record: 10567

I hear all these rumors about Atari. Someone confirm or deny them.

#1 - Layoffs at Atari

The bashers keep talking about the Atari layoffs. How extensive were the layoffs? How many people are left?

#2 - Falling stock

What gives?

#3 - The Wal*Mart story

Does Walmart, or does Walmart NOT carry the Jag? Why don't any of the Walmarts here in the Portland/Salem (OR) area carry the Jag? I hardly see any space for a display in the electronics section of the store. From what I've read over the net from those who have seen Jags in Walmart, most claim that the system is stuck way up high on a shelf, not set up for demo, and the games are locked away in a case without display cards hanging as the Sony/Sega systems have. True or false? Are there no Atari representatives touring the retailers to set up displays and promote their products?

#4 - Babbages is dropping the Jag

I heard that when current stock clears, there'll be no more. Substance to this arguement?

#5 - The magazine press

Negative Jag press is nothing new, but I read in one of the Anti-Atari rags that Atari is becoming a software-only company and that the PC will be the primary platform they support.

#6 - $99 price to clear remaining stocks of Jags

This could be complete hogwash, or it could be true. True, the SNES and Genesis met their greatest success at this price point, but one has to admit that the margins must be *very* small on a $99 RETAIL price. It's only now - after five years of production - that the 16-bit systems have come down to this price. They sell TONS more SNES and Genesis systems than Atari does Jags, and of course the 16-bit systems are cheaper to produce with their dated technology and enormous quantites of production.

These could be just BS rumors, but if they are all considered together, each rumor seems to reinforce the others. I hear Tempest 2000 is coming

out on PC????

Food for comment....

James

Don't say that!

You know the only reason most of us visit comp.sys.atari.advocacy is to partake of the comic relief that "Programmable Sound Device" (aka Peter Sinclair Day) provides.

Without him here, it'll be a tad too mundane. We might just have to call back our old friend Roger. And put up with the illegitimate illiteracy he parcels out with abundance.

So, Petey, please do not "recover". We need you.

Really..Must be based upon a crystal ball reading. According to the recent
International Data Group and DataQuest Apple's share is above 11%.

>

Really. 20%+ unit growth annual. Mac sales in 1995 amounted to 5 million
units. Indeed, Apple is in trouble.

>

Unfortunately for Computer Shopper, Apple's market share wasn't at 15% 14 months ago (I don't think it's ever been higher than maybe 10-11%). They are currently neck-and-neck with Compaq and Dell for percentage of new computer sales (they are third, but the percentage difference between the three is extremely small).

CS is worth reading if you want to bargain shop, but their editorial and columns are crap.

>It also talks about how the company is suffering from mismanagement
>of supplies

This is true. This fall, they had about $1 billion in backorders, due to misprediction of demand for their new line of PCI PowerMacs.

> and that it's move to lisence the hardware to other
>manufacturers is too little, too late.

That remains to be seen. It's a little early to completely discount it.

> They see the trend in
>declining marketshare continuing. Will the Mac be in the same place
>as the ST? Perhaps!

No. The ST died because Atari didn't ever care about supporting it; I think the Tramiel family never learned that computer companies require large R&D budgets or they will inevitably fade away. The only thing that kept the ST going after it became obvious that Atari didn't care was the incredible devotion and loyalty of ST fans, many of whom were willing to keep buying the slow trickle of new designs in hopes that someday the company would wise up.

>
>And it's all because of you, Peter! See what you have done? Your
>fanaticism is hurting the very company you support!

You're a real wonder. For no other reason than Peter's liking of Apple, you have decided that Apple is scum and root against it. I guess this means that Peter now controls your thoughts; he can simply post support for the inverse of whatever he wants you to believe and you will adopt it wholeheartedly. If that isn't totally irrational fanaticism, I don't know what is. Furthermore, you've revealed to the world that you actually care what Peter thinks of you.

Having observed Peter's posts for some time, I would have to say that he's at least a little strange; I don't know why he feels the need to go into advocacy groups and slug it out. The responses he provokes are much more interesting, though. By no means does he justify the level of hatred that is often directed towards him. He's just a troller, and a particularly inept one at that (most of the time he cannot form a very logical argument, and just bashes). I don't think he even consciously intends to troll, he just gets some form of satisfaction from stirring up flames in advocacy groups. It never fails to surprise me that people fall for it. And when they do, all too often they really fall in the trap, becoming nearly a mirror image of Peter in their quest to oppose him.

>Hilarious!

Indeed.

3471. Re: Why flame Jag? Post facts.

Newsgroup: comp.sys.atari.advocacy
Date: 1996-01-05 00:00:00 UTC
From: mrathwel@uoguelph.ca
Message-ID: <4ciadh$1vn@ccshst05.cs.uoguelph.ca>
Source record: 10576

: The bashers keep talking about the Atari layoffs. How extensive were the
: layoffs? How many people are left?

About ten people laid off. More than 100 left.

: What gives?

Competition from Sony and Sega. The stock is rising again though.

: #3 - The Wal*Mart story
: ----------------------
: Does Walmart, or does Walmart NOT carry the Jag? Why don't any of the
: Walmarts here in the Portland/Salem (OR) area carry the Jag?

Some Walmarts carry the Jaguar. It's restricted to the larger
stores in kind of a test run.

: cards hanging as the Sony/Sega systems have. True or false? Are there
: no Atari representatives touring the retailers to set up displays and
: promote their products?

There are reps, but probably not as many as the bigger guys have.

: Negative Jag press is nothing new, but I read in one of the Anti-Atari
: rags that Atari is becoming a software-only company and that the PC will
: be the primary platform they support.

A rumour that has (for now) been stretched out of proportion.

: This could be complete hogwash, or it could be true. True, the SNES and
: Genesis met their greatest success at this price point, but one has to
: admit that the margins must be *very* small on a $99 RETAIL price.

Most companies sell their machines at cost and try to make it up
on software. It seems unlikely that the Jag gas been axed, though Atari
has probably scaled back.

Peter,

I think you need to re-evaluate Apples situation. Once you do you will see how much trouble they are really in. Their sales are going throught the roof but they are making no money. When you sell everything you can make but have nothing at the bottom line to show for it then you have major problems. Apple can not continue to operate in this mannor. You will see certain product lines dis-continued because they were two expensive to manufacture. Here in Austin TX, Apple has plans to build a huge support complex. It is now on hold. Why ? Because Apple is about to lay off workers that were going to fill that complex.

You can spout sales figures and market share all you want. If the bottom line is in the red then you can expect that to have multiple effect though out the company. One area that Apple is going to hit is R&D. They spend a hugh amout of money on R&D and have been for the last few years but they have only seen marginal return on the expenditure. Their are a lot of products that will never get out of Apples R&D labs due to the above problem. The way I see it. By the end of 1996, Apple will probably merge

will another company.

Regards,

3479. Assistance with an Older atari system....

Newsgroup: comp.sys.atari.advocacy
Date: 1996-01-06 00:00:00 UTC
From: rob.mcgillen@uoknor.edu
Message-ID: <4cmu5g$18m@norm.uoknor.edu>
Source record: 10584

I am need of some assistance for my elderly grandfather-

He has owned an atari system (the best info. I have is a
Disk OS of 2.0 ????) for approx. 10 years-

Over the holidays, it has mysteriously quit working ....

This is the kind of system that has two cartridge slots
on the main chassis above the keyboard.... an external single/double
density drive and 4 peripheral ports up front for game playing.

The normal boot up process is having a boot cartridge (BASIC) in
a cartridge slot and a 5 1/4" Floppy (single density) in the external
floppy drive.... once booted- any of the programs can be accessed....

At this point... the system boots... but when he goes to run
the programs- nothing works- it does not run any of the software.

I am recalling most of the above from memory-
the last I looked at it was approx. 5 years ago....

Anyway- his "life" is on this machine and being without his
financial records,etc. etc. is really frustrating him...
and at his age, the technical concepts escape him...

I am 2000 miles away.... and will not get a chance to look
at this machine... but he definitely needs help....

I have racked up over 3 hours of long distance bills trying to help to no
avail.....

Help- if you have any suggestions- please drop me a line....

My apologies if this is in the wrong group.... I would appreciate any
and all suggestions, assistance.....

Thanks
Rob Mcgillen
rob.mcgillen@uoknor.edu

I read the same, was not a press release but an article on the video console market. In that same article also stated that only 200,000 Jagflops were sold.

: You have me, I will admitt it that I have a desire for the Jag->....Once the
: price of the base console falls to $50, maybe.

You said the same thing about the $99 Jaguar.

: Knowing Atari, I may take a year to get my order. No thanks, Toad may do.

I guess you haven't ordered from Atari in the last two years?
They've always been super prompt with my Jag, Lynx, and more recent 7800
stuff. And I don't live in the U.S. This is one area Atari has really
improved, IMHO.

Unfortunately, Tim, you've lost again through insults. I still recall the
open system debate where you called me a "jackass" because I noted that
Apple has made it impossible for developers to make an alternative OS
for the Mac.

The simple fact of the matter is, Apple's shipments of Macintoshes have been
primarily low-end systems like Performas, with no margin for the dealer and
less for Apple. High-end PPC systems aren't selling as projected, and in
order to make bigger margins, dealers are steering users away from $1400
Performas with no margin to Packard-Bell and Aptiva systems with greater
margins at a similar price. Apple is now suffering from the ST/Amiga syndrome:
systems growing comparitively more expensive, with smaller sources of software.
Apple has also announced that it expects to post a loss with "material
financial impact" (read: a pretty big loss) due to slow sales of PowerMacs
and inability to supply enough lower-end machines to meet demand. This is
EXACTLY what killed Commodore - A1200's were indeed selling VERY well, even
at the time of liquidation, but Commodore didn't have the resources to
bring production in line with demand. Losses mounted, first small ones,
later, larger ones. Efforts to sell the company failed, and with an inability
to pay its bills due to heavily negative cash flow and credit on the rocks,
they closed.

Apple may not liquidate, but sunny days are not in the forecast for Cupertino.

I don't buy into the whole concept of losing arguments just because I insulted the opponent. If I refute all your points, and call you a jackass, does that mean I lost? I think not. You may claim such a victory if and only if my entire argument consists of calling somebody a name.

> I still recall the
>open system debate where you called me a "jackass" because I noted that

I called you a jackass because you were acting like one.

>The simple fact of the matter is, Apple's shipments of Macintoshes have been
>primarily low-end systems like Performas, with no margin for the dealer and
>less for Apple.

Here is the list of top selling Macs in December, as reported by the most recent MacWeek.

Nov. Dec. CPUs

1 1 Performa 6300/100 16/1200
2 2 Power Mac 7500/100 16/1000/CD
* 3 PowerBook 5300ce/117 32/1100
4 4 Power Mac 8500/120 16/1000/CD
* 5 Performa 6205CD 8/1000

Note that it isn't until #5, the Performa 6205, that we get a relatively low-cost system. (The 6300/100 sells for well over $2000, and is quite a nice machine; it's got a 100 MHz 603e processor.) In fact, here's how I would rank each one on a touchy-feely scale of high-endness:

1. 6300/100 16/1200 Midrange
2. 7500/100 16/1000/CD High-midrange
3. PB 5300ce/117 32/1100 High-end (>$6000!)
4. 8500/120 16/1000/CD High-end
5. 6205CD 8/1000 Low-end

> High-end PPC systems aren't selling as projected, and in
>order to make bigger margins, dealers are steering users away from $1400
>Performas with no margin to Packard-Bell and Aptiva systems with greater
>margins at a similar price.

Are you kidding me? The PC clone market has very small margins.

> Apple is now suffering from the ST/Amiga syndrome:
>systems growing comparitively more expensive, with smaller sources of software.

Actually, it wasn't until the advent of the PowerMac that Apple started to compete in price/performance. Prior to that, they had underpowered systems with prices that were consistently higher than the PC/clone market. Right now, their model of operation is to bring out new CPUs that have comparable price/performance with good brand-name PC clones *at that moment*, but they don't subsequently cut prices fast enough to keep up with the PC market. I would say this is much better than the pre-PowerMac situation.

As for software - what are you smoking? Yes, the Mac software market is smaller than the PC (always has been), but the same-ol-same-ol major packages continue to be released for both platforms. It is interesting to note that in the games market, more and more of the major PC titles have ports planned or completed, and many games are now coming out for both machines simultaneously (Descent II, for instance). This would seem to indicate better penetration into the home market.

Here we go again.. Apple's sales will be up in the past period. True, Apple's
margins are small in the 20% range, but soo is the Wintel platform. Apple did
not have the right product mix to compensate the low margins due to component
shortages. But, component shortages are no more according to Apple in a press
release and that ALL models will be available in supply according to market
needs this period. Apple is reportedly will lose $11 million for the past
period but may take a $100 million charge to cover layoffs. Apple needs to
redo their business model to compensate for low margins. One target is their
bloated R&D..

I predicted Atari would be out of money but did not compensate for the Sega extortion money. I never said that Atari would not have 20 titles by X-mas 95. I predicted that Atari would miss the continous market dates for their cdrom.

The only thing I can comment on with any assurance is the WalMart thing...

The ONLY WalMart stores that are carrying the Jaguar are their big "megastores" that have integrated grocery sections along with the regular KMart stuff.

Oh.. and yes, Tempest 2000 PC is a reality. It's going to be sold as ShareWare for $29.95 on CD.

I've played the demo (never saw the Jaguar version, but people have been saying that it's virtually identical except there's no "Melt-O-Vision" effects), and my only comment is:

Does the word "Livewire" mean anything to anyone..?

It was an article focused on Atari's entry into the PC market; they do
not have any experts quoted on the sales figures. Dataquest and others
have estimated the number of Jags sold to be close to 450,000 as of
right now.

Peter, you've been quoting 150,000 and 200,000 figures for the past
8 months now. Use your couple of brain cells for a minute. If sales
were still at this mark, that would mean that 0 Jaguars have
been sold in the last 8 months. Does that make sense? Not really.

You need the HD Driver. Now this one should be on the Harddrive itself (the
bootsector will then load it for you). If not, you need a disk which has
got the driver inside its auto folder.

Last April, that was nine months ago. Why hasn't Atari updated the unit sales recently? By the way what is Toads Web page address?

"Margins of 20%" that translate into atrocious financial results PROMISED by Apple during the biggest sales period of the year? Hardly.

Time to face it, folks, Apple is in fairly dire straits, especially with the downscaling of Mac sections in most every computer store I've been in. I interrupted a sales drone at Computer City "explaining" to a customer that the Macintosh "can't do CD-ROM" as well as the wonderful Packard-Bell Pentium he was trying to sell the poor soul. I asked what he meant by that, and he stated that Mac sales were so poor in the store that it was scaling down software and hardware sales, and that the only people buying Macs at this location were current Mac owners. Of course, the "can't do CD-ROM" was nonsense, but a walk into any Computer City or other computer superstore will show Mac sections (hardware and software) shrinking in favor of PC clones.

I still remember the Commodore enthusiasts who were told by ex-employees that C= was in dire straits despite its "record sales performance" - that it wasn't ready for PC clones. Three years later, they proved right. How, Mr. Sinclair, is Apple going to rescue itself from these doldrums in computer superstores and other retail locations? How is it going to explain the Christmas season losses?

Apple's current situation reminds me of the lesson we Atari people have known all along - putting faith in a single company to "do the right thing" is fatal. Now that TOS and the hardware are in the hands of multiple hardware and software companies, there will always be a market for us. Who knows about Mac. . .

Yes, Apple screwed up..But management will take the necessary steps to shore up
the margins. Expect the plans next Wednesday.

Really, in contrast with the increased sections at the Best Buy's I have been
in as well as the local Software Etc..However, most Mac users buy from the
big three; MacConnection, MacWarehouse and MacZone. I have yet to purchase at
my local Software ETC, unless their prices are in line with the Big Three.

This I don't get.."Only people buying Macs are current owners" Isn't that true
with PC users as well?

He he he he he..I remember this going back to 1981...Commodore's situation was
vastly different than Apple's current woes. C= was in heavly debt and had no
money to pay back their creditors. Suppliers who were owed money from previous
years refused to provide component parts on credit to C=. Apple has hardly any

debt and component shortages for their higher margin products have eased considerably. C='s record sales were somewhat exagerated with huge supplies of Amiga 600..

NOT! See below.

>> Apple
>> may not liquidate, but sunny days are not in the forecast for Cupertino.

>According to you..

What dream world are you living in, dork? Check this out:

--- begin press release ---

CUPERTINO, California--January 10, 1996--Apple Computer, Inc. today said that it has completed a preliminary review of its financial results for its first fiscal quarter which ended December 29, 1995. The Company stated that while unit shipments and revenues increased, compared to the same quarter a year ago, gross margins declined significantly, resulting in an operating loss for the Company. Apple had disclosed on December 15, 1995 that unit shipments, revenues and gross margins were not meeting internal expectations, and a loss could result if the trend continued.

For the quarter, unit shipments increased 12% over the year-ago quarter and revenues increased 11%. However, gross margins dropped to approximately 15% compared to 20.7% last quarter and 28.7% in the year-ago quarter. The Company's net sales and gross margins as a percentage of sales were both below the Company's internal projections, and as a result, the Company now expects to record a net operating loss of approximately $68 million after taxes, or $.55 per share before restructuring charges.

The Company is evaluating the quarter's results closely while it undertakes a thorough review of its operations. Among the actions the Company will take is a restructuring of its business, and record a related charge against earnings in the final first quarter financial results. The Company will be prepared to discuss the details of its financial results as well as the initial phase of its restructuring when it announces first quarter results on January 17, 1996.

The Company attributed the shortfall in gross margins and operating profits to price reductions the Company implemented in response to intense price competitiveness in the personal computer industry, especially in Japan, as well as inventory adjustments of approximately $80 million before taxes to reflect current pricing pressures.

"We are obviously disappointed about the results for the quarter and are taking actions to meet our challenges," said Michael Spindler, Apple's chief executive officer. "It is our top priority to return the Company to profitability and provide value to shareholders.

You should answer your own..Getting personal I see. Its different with Atari when the firm has contious losses quarter after quarter, but when Apple has temporary woes, its gloom and doom. Apple is a $12 BILLION firm. $68 million is nothing. And management is making the appropriate steps to get back into the black..

Goldstar has stopped producing their 32 bit console because current
inventory will last until M2 comes out. I am happy with the $199 GoldStar with
two awesome titles. Plus Panasonic will stop production of their 32 bit console
soon to make room for M2 as well. I could say that Atari is liquidating the
Jag because of the new lower price. No upgrade? I may have one because
Panasonic has invested $100 million plus in M2, I am sure they want to recoup
their investment. Time will tell. No upgrade path to Jagflop II for you,
Kevindork..

Not too hard, considering most stores only keep one Jag in stock.

I thought they were called PC Connection, PC Warehouse & PC Zone? It's
funny but that's the catalogs I get at my job. These Mac versions
must be some boiler-room operation. ;^)

>This I don't get.."Only people buying Macs are current owners" Isn't that true
>with PC users as well?

Yeah, and with 80x86-based Unix users as well.

>> Christmas season losses?

They're going to join C= that's how and hold a 1 year long auction in
which some German company will buy them.

>He he he he he..I remember this going back to 1981...Commodore's situation was
>vastly different than Apple's current woes. C= was in heavly debt and had no

>considerably. C='s record sales were somewhat exagerated with huge supplies of
>Amiga 600..

Apple's problem is keeping prices down. It's about equivalent to C='s
situation. Well anyway, C= went out of business and the Amiga was
bought by someone else and is starting up again, the same thing could
happen to Apple. It would be good to see an advanced OS come out
from a new owner. Maybe then I'd get a Mac too.

>> Apple's current situation reminds me of the lesson we Atari people have known
>> all along - putting faith in a single company to "do the right thing" is
>> fatal. Now that TOS and the hardware are in the hands of multiple
>> hardware and software companies, there will always be a market for us. Who
>> knows about Mac.

Once again, the Amiga was dead for over a year & now it's back in
business. Who knows what will happen? Maybe Bill Gates will get hit by
a truck, that would solve alot of problems.

>We Mac people are not in the same situation. We can choose from Radius, Umax,
>SuperMac(soon), DayStar and PowerComputing.

This doesn't help Apple itself out much.

According to MMWIRE, Atari will ship 75,000 Jags in 1996 down from 200,000 in 1995. Looks like Atari is letting the Jag die an agonizing death. You figure with a $99 price tag, would fly off the shelf. Even Don Thomas stated that Jag fans should get the word out to their friends about what a wonderful console the Jag is. Even Sam Tramiel also stated that durring the ST era. You know what happened!! Looks like Atari will give up or curtail Jag advertisement. I see shades of the Lynx, ST, Mega ST, Stacy, TT/030, Portfolio, Falcon and now the Jag...

3533. Jag advertising

Newsgroup: comp.sys.atari.advocacy
Date: 1996-01-16 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4dg8oa$ihr@inca01.inca.co.nz>
Source record: 10491

Here's an idea for advertising the Jag that I bet Atari wont take up.

Get a group of people together, and have them talk about what great new things thay have just bought.

One says "Nintendo", another "Sega"...

Then have one say "I just bought a Jag".

Fade to image of person driving Jaguar car, and then back to group.

Group looks enviously at Jag owner.

(Hey, it'll work well for the highly class-oriented, "I'm better than my neighbour" Americans).

And there is a tie-in to a "buy a Jag and win the car" promo that Americans are so fond of.

{ Okay, you can stop laughing at that idea now }

: Now that the Jag is $99, will the Jag become the next Nintendo SNES?

Nope. They kinda need Nintendo's marketing muscle to do that.

What
: titles will make the Jag excel and the buying public to take notice?

NBA Jam TE, Aliens Vs. Predator, Rayman, Mortal Kombat 3, Phase
Zero, Fight For Life, Primal Rage, Battlemorph, Dragon's Lair,
Hoverstrike CD, Myst and quite a few others are looking good.

: How much do these titles cost? Cheapest mailorder?

It really depends where you shop. About ten minutes from my house
is an Electronic Boutiques which sells games at various prices (same for
all systems). Older games like Dino Dudes and Trevur McFurr go for around
$20. Next up are games like Kasumi Ninja, Wolfenstein 3-D, Val Di'Sierre
Skiing which go for $30. After that, some of the older 3rd party games
such as Syndicate, Theme Park, Flashback and Cannon Fodder go for $35 to
$50. Rayman is $55, and it goes up from there. The newer games go for
about $78 and this includes the latest releases as well as CD-ROM games.
The most expensive games are the TWI games which go for $90. <prices in
Canadian dollars>

As for mail-order, Bits-o-Fun and Chips & Bits supposedly both
have good prices. I've never had to mail-order, so I wouldn't know for sure.

Actually, Atari just released some figures...

They "sold though" 150,000 Jaguars in 1995 (that means actually bought by consumers).

The total number sold to stores in 1995 was 200,000.

Atari expects to sell 75,000 Jaguars during 1996.

: consumers).

These are US figures, so that would put the overall base of the
Jaguar pretty close to what analysts predicted ... 450K. They had sold
about 130K in the US as of January 1, 1995, plus another 80K in Europe
around the same time. That equals 380K sold, not counting what machines
have been sold in Europe this year. 450K sounds about right.

BODY:
Atari Corp. president of North American operations Ted Hoff ankled his post
Wednesday, following layoffs of 20 employees and amid reports that the company is liquidating its videogame assets. Those assets include Jaguar, Jaguar CD, and
According to a report that first appeared in Bethesda, Md.-based Multimedia
Wire, Jack Tramiel, who purchased Atari from Warner Communications in 1985, plans to use $ 50 million in cash currently tied up in Atari to make an investment in a computer hardware firm.

Sources close to the company said lack of interest in the business on the part of Tramiel and his family -- not lackluster sales -- is behind the move.

Hoff told Daily Variety he resigned because of the direction the company was taking with the layoffs: "It was an indication that Atari's long-term intentions
were not to continue in pursuit of videogame developing or publishing, neither for Jaguar nor Atari Interactive."

Hoff said the layoffs include staffers from the engineering, testing, production, customer service, marketing, merchandising and advertising areas.

Those left, he said, don't constitute "the ranks you would need to continue in the videogame industry."

Before joining Atari in June, Hoff had been VP and general manager of Fox
Atari chief financial officer August Liguori denied any assets are being

liquidated. "We're not going out of the videogame business. We have $ 50 million, and we're going to continue making strategic investments and developing
and publishing for all our platforms," he said.

But sources said it's unlikely that development deals already under way will proceed, and said the Jaguar vidgame hardware and CDs no longer are being manufactured. In addition, sources said, Atari plans to vacate its office space by the end of next month, and its warehouse must be emptied by the end of April.

Which is mistaken. Apparently this was not an announcement, but
rumours that have been published in some prominent places. The
reports have indicated that this information comes from company
sources. Atari's rebuttal is located at: http://www.imagine-inc.com/ng/

Time will tell.

Jesus.....Are you so in denial?

Ted Hoff who was recently interviewed after he left Atari stated that the
people remaining after the layoffs do not constitute a company remaining in the
video game market. Atari fired engineers, game testers and support people.

This statement proves that you have absolutely no understanding whatsoever of market economics. Tell me, Peter, which will sell better:

A. A game console priced at $99 with a huge advertising presence, a cash-rich company to back it up, and stocked in every single mass market location across North America;

OR

B. A game console priced at $99 with a nonexistant advertising presence, backed by a company with little cash and few resources, and stocked only in small retail chains and specialty stores.

Considering this, and the fact that Atari's sold base of Jaguars total stands at approx. 325,000, they did pretty well with what they have.

That's really a paranoid fantasy. I think a more likely scenario
is that

a) Atari's cutting of the Jag price + laying off some programmers
inspired the first rumors and

b) Ted Hoff's commetns about Atari's actions being "inconsistent"
with staying in the videogame business has inspired the
current rumor.

Denials to the contrary, I think both a and b are indicative of
Atari at least abandoning the Jag, and probably the business as
well. But that's just my view, as a long-time Atari-watcher.
I certainly could be wrong.

: Atari had many opportunities to make the ST, Lynx and the Jag a success.

Atari did make the ST a success in Europe. It was the number #1
machine there for many years. The Lynx was a total screw up on their
part. As for the Jag, they really didn't have the opportunity to make it
a success. Why? They had too few resources and had burned to many bridges
as a result of the Lynx fiasco to really make the most of the Jaguar. If
the Jaguar went into X-Mas 1994 with a much larger library, the Jaguar
would definitely be in a better state given a) it's price, and b) the
state of the art technology (which it was prior to the PSX and Saturn).
Unfortunately, they didn't have enough $$$ to get the ball moving well
enough before Sony and Sega jumped into the pond.

: Intuit, the publishers of Quicken with the fraction of resources successfuly
: took on Microsoft and clobbered MS Money.

Software is very different than hardware Peter.

: Atari burned to many bridges with retailers in the past and who presently
: refuse to deal with Atari and the Jag.

I thought that Ted Hoff did an admirable job rebuilding some of
those bridges, but now that he's gone, the Tramiel's don't seem
interested in pursuing his work. Sad, really.

: If you say so....Considering it took Atari 2.5 years to achieve those sales
: while Sony USA sold 800,000 PlayStations in three months.

How big is Sony? How big is Atari? 'Nuff said. In all honesty,
the PSX really isn't selling that well either. Seems like the whole
Industry is struggling. Sega sold 20 million Genesis consoles, yet barely
moved 400K Saturns. How many Virtual Boys did mighty Nintendo sell? 3DO
is ready to jump to the M2 after only 2 years with a console that
originally sold for $700. Something is up. Maybe it's 1984 all over again.

>Completely.

No.

You mis-read the MMWIRE article. It was NOT an announcement from Atari Corp.
in any way. It WAS based on an interview with Ted Hoff and gave his views
of the situation and his projections for the future.

Atari Corp HAS released a denial of the information contained in the MMWIRE
report.

In other words, the "Atari announcement" was that they DO plan to continue in
the video game business.

Atari is in a state of turmoil. I know that many of you LOVE to flame Atari, but the person (or persons) that SHOULD be flamed are the Trramiels! Don't!!! Tell them EXACTLY WHAT YOU THINK. Atari has been with us for 25 years, from Nolan Bushnell to Jack Tramiel to Sam Tramiel to ?????. Atari INSPIRED the video game business. If it hadn't been for the ATARI we used to know, video games wouldn't have come around until 1990 or so. Even back in the early days of video gaming history, Nintento's owner approached Atari to market the NES. True, Atari has made some stupid moves over the course of history, but without them, where would we be???

If there hadn't been an Atari VCS, where would the Intellivision, Colecovision, NES, SNES, Sega Master System, Genesis, VideoMax, Saturn, CD-i, 3DO, GameBoy, GameGear, PlayStation, and Ultra 64 have come from??? Sure, the respective owners could make them, but Market Competition speeds development, and without Atari being there, there would have been LESS PUSH! Some of you would tend to disagree, I know, but here is a small list:

Atari spawns the: Atari 2600 VCS

others follow: Intellivision, Colecovision, VideoMax, NES, SNES, Master System, Genesis

Atari spawns the: Lynx Handheld Game System

others follow: GameBoy, GameGear, VirtualBoy, Nomad

Atari spawns the: Jaguar

others follow: Saturn, 3DO, Playstation, U64

Now, I'm not sure about the 3DO part, but the rest I'm quite sure followed Atari.

I'm NOT SAYING that ATARI IS THE BEST! What I'm saying is that, with the lead on innovation, NEWER and BETTER products followed. If Atari were to shrivel up and die (as it seems they might) I'm sure that a few would CHEER, but there are many more that I'm sure would see the END OF INNOVATION and the eventual death of video gaming as we all know it!

********** IMPORTANT **********

I am asking that you read the article below. I am asking that you "DO THE MATH" and see what is to become of the video game industry. I'm asking that you HELP US and YOURSELVES and tell Atari NOT to leave the video game business, or, SELL Atari to someone who could carry on the name and make it GREAT again!!! Fax Atari, send them e-mail, send them

snail-mail!!! Here are the addresses and numbers:

Jack Tramiel, Chairman of the Board
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089-1302

Fax: 408-745-2088

Phone: 800-GO ATARI

e-mail: atari@aol.com - General Customer Support
75300.1267@compuserve.com - Don Thomas (Dir. of Customer
Supp.)

Now, read this article, visit rec.games.video.atari and search the net
and SEE for yourselves what is going on!

I hate to ruin your day, Peter, but I read another report which stated
that Ted Hoff denied even _talking_ to Variety, much less making those
statements. I think that Ted Hoff is more intelligent than that to
burn any bridges that could result in not being to build new ones.

Indeed it was. There must not have been much fierce competition in the market. Who is the great success in Europe NOW, I ask you? ONLY ATARI could neglect their userbase and market and SQUANDER such a lead.

> The Lynx was a total screw up on their
> part.

UNDERSTATEMENT OF THE DAY!!!! Say it a few more times in capitals for emphasis. They screwed it up BAD!!! The Lynx was so cool.....brings tears to my eyes and I wonder how it could have happened.....OH...wait a minute...this is Atari and Tramiels....they could screw up a wet dream.

> As for the Jag, they really didn't have the opportunity to make it
> a success. Why? They had too few resources and had burned to many bridges
> as a result of the Lynx fiasco to really make the most of the Jaguar. If
> the Jaguar went into X-Mas 1994 with a much larger library, the Jaguar

So blame it on the Lynx.....and whose fault was that?? ATARIS!!!! So what you're trying to say is that it wasn't their fault because it was caused by another of their total blunders? I have difficulty seeing how you can defend them on this account unless you're totally Atari-obscessed or possessed (beyond a reasonable level of objectivity). Yes...if only the Jaguar went into Xmas 94 with a much larger library, if only the price cuts came sooner than the week before Xmas when the print ads were all out at $149, if only they hadn't made SO MANY PROMISES with release dates (X number of games before such-and-such date which wasn't met), if only vaporware hadn't turned off more customers (hook Lynx to Jaguar with this cable we're coming out with, here are the VR goggles we're coming out with), if only the infomercial hadn't been pitched at mentally-challenged, if only this if only that....it's all Atari's fault. Who else are you going to blame it on? Can't you for once admit that this company is killing the Jag like they did the Lynx? Can you not stop sifting through the ashes of the wreckage for nonexistant evidence to disprove what was clearly a crash caused by pilot error?

> would definitely be in a better state given a) it's price, and b) the
> state of the art technology (which it was prior to the PSX and Saturn).
> Unfortunately, they didn't have enough $$$ to get the ball moving well
> enough before Sony and Sega jumped into the pond.

Wait a minute......if they hadn't BOFFO'd the 7800 system and XEGS back
when they had a fighting prayer, your story might have some merit. Back
when there was no Sony and Sega was losing already (SMS), Nintendo was a
small company and clobbered them the same. Atari had the $$$ to "get the
ball rolling" and all they got was a bunch of OLD 8-bit computer titles
burned into ROM (circa 1983-1985) while Nintendo had Mario as popular as
Mickey Mouse. Whatever $$$ they had back then were not used effectively,
and what $$$ they have (had??) now are not. They just don't put enough
into software development, whereas Nintendo does the opposite. The U64
was only delayed (the last time) so a great launch could be made with
fantastic games at the start. We got Cybermorph from Atari and a slew of
duds with a couple decent games, until more recent times. Too little too
late? Could it be Atari is too quick to jump the gun on everything?
Hardware debuts with too little software. Vaporware announced before
it's even a light year from the dealer's shelves. Promises for "X"
number of games by "such and such" date made with no basis in reality.

>
> : Intuit, the publishers of Quicken with the fraction of resources successfuly
> : took on Microsoft and clobbered MS Money.
>
> Software is very different than hardware Peter.
>

There are two sides to that arguement. We could make a complex theory
that "software is different than hardware"(how many factors would such a
theory involve?) or a simple one that compared an innovative and
fast-moving small firm (Intuit) against a huge, slower-moving firm
(Microsoft) and then use the simpler theory to differentiate Atari from
Intuit because while Atari is small, they are not as
fast-moving (Jag's tremendous market lead time squandered, for example)
nor as innovative as their competition (Trevor Mc Fur, Club Drive (!!!)
Highlander, etc.) as opposed to Intuit, and Atari is in the software
business too (even if only for their own console) and in the console
market, software is more important than hardware and if Atari would have
handled the software right, the hardware would have been taken care of and
of course this is where Atari goofed. It isn't difficult to see how they
repeatedly blundered; a child could do it and in fact many have (hence
all the childish JagBash bickering and name-calling). I just can't
believe anyone would still defend Atari, no matter how much they love the
hardware and the "cute little Atari logo."

> : Atari burned to many bridges with retailers in the past and who presently

Sad? Perhaps for some. Surprising? No! (well, maybe to that same some)

> : If you say so....Considering it took Atari 2.5 years to achieve those sales
> : while Sony USA sold 800,000 PlayStations in three months.
>
> How big is Sony? How big is Atari? 'Nuff said.

I disagree. Not 'nuff said. How long was Atari's market lead with the Jag over the PSX? How long was Atari's market lead with the lag over the PSX? Once again, I put the question to you: How long of a head start did they have? When did they go to $99? A couple days before Christmas with $149 ads flying all over the place(!!??!) instead of sometime earlier during that TREMENDOUS lead. Ok. Now 'nuff said.

> In all honesty,

Good points here. However, Atari-lovers better hope there's another "Tramiel" coming around the pike to buy out (bail out?) Atari. On the other hand, do end users want to be Tramiel whipping-boys for another decade? Maybe they should just put that bastardized name and logo to rest as honorably as they can, but they've stripped it of most of its honor already.

At least you can type a different article on your Falcon's word processor
or download some shareware and read new email messages.... With your
Jag, are you really going to be entertained by the same games in 10
years? If so, good for ya. You probably still drive a VW Beetle and
think it's modern!!

Agreed, the Wintel platform is agin, but with steroids in the arm all the time. Somehow I don't share your viewpoint after playing Wipeout on the PC (I was a nay-sayer at first about this game) and considering the new P5/150 mHz, P5/166mHz, and future potential of the P6 and all of this in combination with new 3-D cards. On the flip-side, yes they will be damn expensive (only at first, as with all PC innovations) and always cost more than a Jaguar (many times) but you weren't considering price in the above and only stated that the Wintel platform will never match the Jag, which is false.

I know Atari has often led the way but that was in the past. If you
were Sam Tramiel sitting on your faxmachine was a load of mail
complaining at you and your style, I think you probably just ignore it.
Face it Atari is dead ot dying and will only survive as a parent to
some other outfit, not as a mainstream hardware supplier.

Sorry, but thats the way it is.

It's my understanding that Atari has received all of the Sega money already,
and it's gone. Atari has $50 million, and that's it. Supposedly,
according to reports, that money is tied up in the alleged new venture.

> where would we be???

Nintendo must not have learned anything from Atari, because Nintendo
knows how to develop new, exciting games and market them. Nintendo knows
how to make money and Atari knows how to lose it. Nobody owes anybody
(such as Atari) a debt of gratitude. Atari didn't make the 2600 as a
service to us; it was a profitable product.

> If there hadn't been an Atari VCS, where would the Intellivision,
> Colecovision, NES, SNES, Sega Master System, Genesis, VideoMax, Saturn,

The VCS is ancient history and has little or no bearing on what happens
today. May as well herald the cavement who invented the wheel when
Lamborghini releases a drop-top Diablo (instead of heralding Lamborghini).

This is the most assinine thing I have ever seen. Atari products
(particularly software) aren't any more innovative than the competition
anymore. I'm quite sure that the industry that Atari pioneered will live
on quite well through others that know better how to do what Atari used to.

If as I suspect Atari drops the Jag in the next 2-3 months, then it is
likely that someone may try and take over the rights. After all there
is a small user base there plus some good games available now and in
the pipeline. I would be inclined to say that the Jag is likely to break
even in the next 12-18 months, perhaps even sooner. All it takes is a little
will power from whoever ends up with the rights.

Unless the Jaguar actually becomes a successful product (if it isn't dropped), then Atari will never be able to re-enter the market. What little credibility that the company had (in the eyes of the general public, not the Atari loyalists) will have been completely consumed in the burning of the Jag and Lynx owners and resellers. If the Tramiels want to continue in business (let's hope not), they'd probably have better luck doing it with another name and logo.

The money is still there in part. The 50 mill is leftover from
the Sega deal (Atari has been posting losses since the deal went
through). There are conflicting reports. Some people say that the
Tramiel's want to liquidate Atari and merge with a new company. Other's
say they are buying up software houses. Whatever the case, if they just
"dropped" the Jaguar after all the promises and BS and unfinished things,
they will never be able to re-enter the market. The sudden dumping of the
Jaguar is too sudden ... even for Atari.

Don't tell me your Performa (Performa? What loser uses a Performa?!) will never need warranty work, either. Last I looked, a Jaguar has fewer moving parts than a Mac -- at a minimum, that floppy drive's not going to last indefinitely...

Source record: 10534

First, let me comment on the Jag situation. I'm not going to comment on the FUD that's been spread all over this group as of late. It doesn't matter whether Atari is "officially" dropping the Jag or not. What matters is the lack of new games coming out for it. That pretty much speaks for itself, don't you think?

This letter is a partial reply to whoever wondered why it is that console systems (Saturn, Playstation, etc.) are selling less than their predecessors did. I believe it is because people who have traditionally been buyers of these systems (teens-twentysomethings) are beginning to realize the advantages of owning a PC. In the past, it was difficult for people who didn't really give a damn about computers to justify paying ~$1000 more for a PC, when you could get a console for a fifth of the price. Console games usually cost more, but it is inconsequential when you look at the overall system prices.

Well, then the Internet happened. And Pentiums. And fast video. And decent sound. Finally, it has gotten to the point where the advantages of owning a PC surpassed those of owning a console system. The WWW, AOL, and the Internet in general have become solid substitutions for playing video games. And if you want new video games, there is no need to go plunk down $50+; Just hop on the net, and download the latest crop of PC games. For a quick example; I recently grabbed the demo of EA's NHL '96. This thing was a virtual clone of the Playstation(or was it 3DO? I forget) version; except the graphics were much sharper.

I don't see video game systems going away *immediately*; I do think computers will get easier and easier to use, and ~5 years consoles and computer systems will be one in the same.

Rich

James Wood <jamesw@PEAK.ORG> writes:

>Atari fans have been a loyal group, alright (including me). We've been
>like whipping boys to the Tramiels, punishing ourselves by becoming
>dependent upon Atari. Break the cycle.

Absolutely. We were suppoed to "keep the faith" in Atari, buy their products, and in exchange, get support and new products. What happens? Atari tells us "we're still in computers" while telling investors that they no longer were. They sell remaining machines at full price, and then "surprise" us with a discontinuation.

What made Atari Atari? Engineers like Shiraz Shivji (gone), Richard Miller (gone), Allen Pratt (gone), Bill Rehbock (gone). Customer relations people like Bob Brodie (gone). What's left? A name? A logo? A failing video game system? What about the company that was once one of the largest, most innovative, and most important computer suppliers in the world?

Any reason to support Atari these days is history. The TOS-related technology and development are in the hands of skilled third parties, which means that the developers and userbase who kept (and are keeping) TOS chugging along are receiving the profits, rather than Atari.

Folks, Atari is gone, dead, history. The flame wars with Amiga, Mac, and IBM users are in the dust bin of history. It's time for us to turn our backs on this comedy called Atari Corporation and begin to take technology it spawned (TOS) where we want it to go, rather than wait for a savior in Fuji form.

Performa? Well I bought a close out model from MacWarehouse I could not refuse. Much cheaper than the Quadra version. As for the floppy drive, it's rarely used..

Here you have it, folks - all hail Robert Jung as the current
"know-it-all" on the newsgroup. The very idea of attempting to assess
"what little brains" the other poster and I have - merely based on our
assertions that we like new and innovative games - is completely
assinine. Thank you, Robert, for demonstrating what a driving intellect
you possess.

The subject was GAMES, and you (in your typical childish fashion) had to
turn it into a personal attack that might spark off a new pissing contest
- a technique you are rather practiced at. Furthermore, you take an
unwarranted shot at Nintendo games in your ridiculous claim that they
have "brainwashed" us.

While on the subject of brains, it should be obvious to anyone with
half a brain that a LARGE number of Nintendo games are of
good-to-excellent quality. For a 65816 system that's as old as Super Nintendo
to pull off many of the games that it does indicates devotion to the
cause on the part of Nintendo developers. When I play Club Drive or see
untextured, unshaded characters in Highlander, I have difficulty feeling
the same way. Games like Donkey Kong Country make it obvious that in
terms of thoroughly utilizing SNES hardware (which does make a great
game), Nintendo deserves recognition, as does Genesis. Interestingly, many
of my favorite Nintendo and Sega games are titles by TENGEN, which (you should
know) is Atari Games. I assure you that they have not "brainwashed" me, nor
are they "too scripted." If the Jaguar was a piece of Nintendo hardware
(hypothetical sense), I assure you that many of the lame Jag games wouldn't
exist, or would have been improved to take advantage of the console. You'll be

playing Club Drive and Checkered Flag while NU64 owners will be playing Cruis'n USA. That's a fact, not taking a shot.

I have yet to see any postings from you that would indicate to anyone that you are a genius. The "reasons" that you feel you are competent to judge "how little brains" I have based on my video game preferences must be the product of your solitary delusion. I suggest that you refrain from falling victim to the emotion that your fanatical Atari addiction stirs in you. Try a little harder and try not to take ascii so seriously. Try to realize that I (and others) like Atari games too, but also Nintendo and others; I don't share in your one-track (one horse) perspective in this regard. I see that Jag for what it is, not for what I want it to be. Judging from what I've seen of your posts, you consider the Jag to be a premier gaming platform of the future, and you consider yourself to be some authority on the subject. While I disagree on both counts, I do enjoy the Jag to an extent, as well as a host of others. The most good you can do is to agree that you disagree with many people (as most fanatics do) and move on. Don't attempt to assess the intelligence of others because you have proven what a poor judge of it you are by trying to use video game preferences as your sole criteria. I laugh in your general direction.

Yeah, Twisted Metal, Jumping Flash, Philosoma, Destruction Derby,
Defcon 5, X-Com UFO Defense, Jupiter Strike, Lemmings 3d-- just
the same-old same-old. Nothing innovative there.

(And that's just a few for the PSX-- I don't even follow the Saturn
or SNES library very closely. I'm sure there are plenty of new
and different games on those machines, too. Just because the
big-name games are the familiar genres doesn't mean that the unique
games don't exist.)

TBird, you know, for about the last month your posts have gotten
really childish and defensive. Do you feel that attacked? That
attached to the Jag that you have to be snippy in its defense?

: 1) IBM Plans to purchase the Jag when Atari drops it and release it both
: as a stand alone consol and as a card for the PC.

Possible, though I don't know if IBM would do a better job.
They've never made a console before.

: 2) Electronic Arts plans to buy the Jag.

Wouldn't that be ironic! :-)

: 3) Nobody will buy the Jag because god is just waiting for Atari to drop
: it and then he's going to come destroy the planet.

ROTFLMAO

I see a few problems with this. First, if the Atari name and logo is not sold
with the Jaguar, then you'd probably lose the recognition that has driven
many Jag sales. Also, the new company would be faced with starting or
inheriting development for the next generation Jaguar. This costs alot of
money and takes alot of time. Frankly, I just don't see smart money doing
this when all indications are that there will be a big shakedown of 32/64
bit consoles between the true giants in the hardware arena. $50 million,
although alot of money for Atari, is a drop in the bucket for Nintendo, Sega
or Sony. Faced with being out-advertised and out-titled, the Jag doesn't
seem to be a good investment.

More proof that Atari zealots have a problem accepting the beliefs of others. Hey little, Mikey, we all are entitled to opinions. Here are a couple more of mine: (1) You're a bonehead (Evident from your "post") (2) The Jaguar is a dead system (3) Atari as a whole should be taken out back and be put out of its misery.

If you have a problem dealing with any of my opinons, then all the better for me (I always enjoy it when my opinions piss people off).

Hugs and kisses,
Kent

James,

Very good points. Robert is a snotty punk. If you don't agree with him, you're wrong. Ignore him.

I don't really care that much for Nintendo games, but they do put out some wonderful titles, most of which have more lasting power than the average Atari title. The Jaguar had one game that had lasting power, and that was T2000, beyond that, I saw no other reason to own the Jag. And now that T2000 is out for the PC, there are no reasons for me to own a Jag.

Robert Jung has been one of the biggest boosters of Atari gaming hardware
since the days of AtariUser Magazine. You may disagree with him, but I
would certainly hesitate before calling him "a snotty punk" - he's quite
in the know in a number of different game-oriented areas.

Sun Microsystems is currently in negotiations to acquire Apple Computer, according to a Wall Street Journal report.

The report cites sources close to the deal who say
Sun CEO Scott McNealy has been holed up with his staff for the last few days, hammering out an offer. One source is quoted as saying, "There will be an
offer on the table soon." Another undisclosed source close to Apple says the struggling Cupertino, California, firm is expected to accept it.
Although details are sketchy, the report states the
deal could take the form of a $4 billion stock swap, which would translate to $33 for each Apple share.
Although Apple chief executive Michael Spindler is set to face the music at the company's annual shareholders meeting in Cupertino today, it is unlikely that a takeover offer will be presented at that time. Sources cited in the WallStreet Journal report say it will probably take a few more days for the deal to be in place.

Well James, you have apparently been brainwashed to the point that you
felt compelled to add r.g.v.nintendo to the newsgroups line and change
the subject header in an attempt to froth up support from your fellow
Nintendo fans. Given the fact that you have been in r.g.v.atari
trolling for a while now, this would be one of the most intricate
flame-baiting projects I've run across in quite some time.

Try and get back to your beloved games before this new hobby consumes
you and you fail to queue up in time to get your U64 on release
date... I'm sure you're getting antsy and just trying to stay
occupied. It won't be long now, I hear.

Actually, you're wrong. This is not an attempt to "froth up support"
from Nintendo fans; they're proabably too busy playing new games. I

figured they should be witness to Jung's antics, since I frequently see his posts there (crossposts) and I wouldn't want Mr. Jung's character misrepresented (by omitting his flames) to my fellow Nintendo readers who regularly read replies by Jung. What I replied to (and quoted of Jung) were his own words, and following his quotes, I made replies in direct reference to them. Did you read what I was saying? Did you understand it? DID I SAY ANYTHING UNTRUE? If you wish to take issue with me, dispute what I said, rather than where I said it. What business is it of yours if I want to post on rgv nintendo? "Frothing up support" isn't the point; I don't need support. I make my own arguements.

> Given the fact that you have been in r.g.v.atari
> trolling for a while now, this would be one of the most intricate
> flame-baiting projects I've run across in quite some time.

Given the fact that I have been in rgv atari for a while???? What about it? What's your point? Did I lie? Did I misquote Jung? You were starving to take a shot at me for opposing your beloved fuji-waving Jung, eh? Couldn't dispute what I said, so you flamed on the basis of where I said it....heh heh heh. Hope you had as much fun writing that as I did reading it.

>
> Try and get back to your beloved games before this new hobby consumes

Mind your business and don't speculate about that which you know nothing about. It might improve your image.

James

Hi, sorry for posting here but this its the only newsgroup my
service gets with Atari postings - Im looking for a new or very
new condition leather belt case for the Atari Portfolio - these
sold for about $30.00 and fit a Newton (and of course a
Portfolio) perfectly - anyone have one for sale at a decent price
E-mail me back thanks
dibelle@deltanet.com

I would have to agree that he is a snotty punk. In evidence of this belief, I reiterate what a flamer he is; attempting to assess the intelligence of others solely through their preference for different games to what he likes - and concluding that these people (of which I was one) must have "little brains" and are "brainwashed" because of different video game preferences. I thought I made this clear. Is this the behavior of someone "in the know" of gaming, or a fanatic who takes offense (and takes issue) with anyone who disagrees with him? I'd say it's more a case of "know-it-all" than "in the know," but each of us is entitiled to his or her opinion. However, I won't call you "brainwashed" or comment on "how little brains" you have, 'cause then I'd be just as bad.

Its funny yo watch both of you lie to each other. Defender 2000 has
not even been ported over to the PC yet. No demo, nothing. Not even
a release date...no mention from Yak (as we did over a year ago on
Tempest 2000).. so please just shut up.

Ok, ENOUGH already. I have gotten enough flames in my e-mail box today to burn down an entire country. I was tired when I posted that message; if I had quoted more than I did, it would be quite obvious I was talking about TEMPEST 2000 for the the PC/Jag, *not* some fictitious "Defender" game. This is nobody's fault but mine, so I apologize to those who misunderstood my message and actually took the time and effort out of their busy schedules to call me "clueless". Thank you.

Those 35 million NES users at least have titles to boot around. Same with the SNES. The SNES is still racking up sales because Nintendo replenishes it with new titles constantly. Atari's owners were never serious about making the Jag a success. Pretty sad and a shame..

I don't know how many games are available for Virtual Boy, do you?

TOTALLY inacurate. I see NES tiles with copyright dates of '93 and maybe
even '94. At this particular time 1/27/96 there are **STILL** a few NES
titles new - leftovers - at Toys R Us and Kay Bee Toys. It wasn't until
1995 that Nintendo "officially" declared they were dropping support.
The fact is that 8 or 9 years after its introduction, I can still buy NEW
NES carts at Toys R Us....and you call it "leaving 35 million users out
in the cold." I call it "giving 35 million users 8-9 years of support."
If what you say is true, the past 3 years of NES support wouldn't have
taken place, as the Super NES debuted in 1991.

Uhh.. yes. Microsoft makes a couple different models, actually. I believe they make an analog version of their new joystick as well as digital...check out their home page and look it up, if you don't believe me.

I'm sure others make them too (Gravis, etc.). Game controllers aren't really that exciting, so who cares. Yawn.

Ahhh.. this is a pale argument. While hard disk do tend to ware out within 10 years, floppy drives, if clean can last up to 30. In either case, my 13 year old atari floppy is still working. :)

: Those 35 million NES users at least have titles to boot around.

I don't argue that the NES had a large number of titles. However,
within a year of the SNES's release, Nintendo cut the price of the Super
NES to $99 without cutting the price of the NES (which was at $79). This
spelled disaster for the machine that had built them. At that price,
nearly all NES developers jumped ship and the software rate collapsed
very quickly. Some time later, Nintendo released the cheaper NES with a
new design, but it was not enough to save the machine.

: new titles constantly. Atari's owners were never serious about making the Jag
: a success. Pretty sad and a shame..

Atari's owners were very serious about making the Jaguar a
success. Even you cannot debate that! They just didn't have the resources
to do so.

: I don't know how many games are available for Virtual Boy, do you?

This has been hard to determine. I've looked around for Virtual
Boy in many places and it is hard to determine what games are available
for it. I think I've seen about ten titles in total. The number is *VERY*
small, especially considering this is a Nintendo machine.

PETER SINCLAIR-DAY <sinclap2954@cobra.uni.edu> writes:

>AtariUser magazine, that explains it. So he is so blind to reality. Calling
>Nintendo users being brainwashed because his precious Jag has failed market
>wise like I predicted all along.

"That explains it," eh, Peter?

Quick question, as Macintosh/Apple apologist in this newsgroup, how do you
explain this weeks BusinessWeek, with the Apple logo on the cover, entitled
"Death of an American Legend" or some other similar term? There are a few
interesting notes in this article, all of which agree with my prognosis:
--
1. Apple is running out of cash - they have $200 million left, (not including
cash equivalents, many of which won't mature to help save Apple in the short
term), and lack the resources to continue discounting Macs to compete with
PC clones.
--
2. Appl'e strategy to encourage "cloning" of the Mac has resulted in total
clone unit shipments of under 200,000 units - as opposed to 4.5 million
Apple-badged Macs.
--
3. Major business accounts like Lockheed-Martin are dropping Apple because
of its lack of attentiveness to corporate clients.
--
4. Apple of Europe and Apple Japan, once Apple's profit leaders, are now
suffering from weak business and are either barely breaking even, or in the
red.
--
5. Apple's projections of sales were so conservative that parts shortages
remain now and throughout 1996, into 1997.
--
6. Sales of high-end Macintoshes are sliding due to competition from Pentium
machines.
--
7. Apple's non-Mac-related divisions, including Newton, peripherals,
Pippin, and other projects, are all money-losers.
--
8. Apple's Internet connection strategies (for products) are falling behind
competitors.
---
9. At the current cash burn rate, Apple will be out of cash by 1997 (and the
$200 million it has now in pure cash is borrowed in a deal made last year).

Currently, Sun is bidding to rescue Apple, at $4 billion, half of what it

would have fetched last year. Key executives are resigning or are being fired for disagreeing with Spindler's strategy to kill cloning of Macs and other foolish decisions. The article concludes with [on the mark] speculation that Apple will either have to jettison assets and shrink to a niche supplier in DTP, or merge with another company capable of funding its current money-losing operations. Either way, it's not likely to ever be the market leader again.
I actually find this news heartening - an Apple/Sun merger would threaten Microsoft and allow greater competition to enter the market, and if Apple shrinks, it will allow more technically and business-oriented companies to take its place.

My, how the mighty have fallen. AtariUser might no longer publish, but he who denies that Apple is in serious trouble is truly "blind to reality," Peter.

: TOTALLY inacurate. I see NES tiles with copyright dates of '93 and maybe
: even '94.

Take a look at the number of NES titles coming out right when the
Super NES was released. Take a look at the number of games axed right
when the Super NES was lowered in price. Nintendo bottlenecked the market.

At this particular time 1/27/96 there are **STILL** a few NES
: titles new - leftovers - at Toys R Us and Kay Bee Toys. It wasn't until
: 1995 that Nintendo "officially" declared they were dropping support.

In 1992, Nintendo lowered the price of the Super NES to $99
without simultaniously lowering the price of the NES from $79 to a lower
price. If that isn't a death knell, I don't know what is. As VG & CE put
it, "Who is going to buy a $79 NES when the SNES is selling for $99. We
all knew the NES was going to die eventually, but this is too soon"

: The fact is that 8 or 9 years after its introduction, I can still buy NEW
: NES carts at Toys R Us....and you call it "leaving 35 million users out
: in the cold."

What I'm saying is that Nintendo didn't pull away from a dying
market (the NES was going very, VERY strong up until the price cut of the
SNES). They shot a healthy system in the jugular. The support for the NES
should have been (and could have been) much greater, but Nintendo was too
greedy to move on with the SNES.

Again, point noted for my "expanding" of the exchange. However, I'm
still waiting for you to dispute WHAT I SAID in my exchange, rather than
continuing to whine about WHERE I SAID IT.

> I won't bother the people who, like
> myself, are tired of this crap by responding to this thread again.

Good, unless you can reference my original posting and find something
wrong with WHAT I SAID, rather than where I said it (again). I suspect
you'll say nothing in this regard.

> Send me email if your feelings are still hurt.

Sounds to me like your feelings are hurt, based on the opening of this
reply, but I can't say for sure because I don't operate on assumption as
do you.

3641. Okami help req

Newsgroup: comp.sys.atari.advocacy
Date: 1996-01-28 00:00:00 UTC
From: rarozijn@xs4all.nl
Message-ID: <4eh0bk$mkf@news.xs4all.nl>
Source record: 10396

Hi everyone,

I have got a problem with my Okami offline-newsreader that I can't seem to solve, whatever I try. The program works perfectly as far as I know (including
gathering and importing news and mail through scripts using the "soup"option) except for one thing: I can't export my replies.
Everytime I try this, in the right place comes a file with no name, consisting
of 13 bytes. If I rename the file, I'm able to look at the file, which always consists the following line:

NEWS news Bn

I've tried every option I could think of.
My system is a Mega STE4, with a
Quantum 425 Mb harddisk, TOS version 2.06. All the internet things are on a 97.9 Mb partition.
I've tried putting the whole setup on a 8.2 Mb partition,
this makes no difference.
I've tried to throw the whole program away, FTPing it again, same result.
Does this problem ring a bell to anyone? I would really appreciate any suggestions you might have.

Thanks a lot !!

Sander.

Evidently it that didn't kill it, since it's still in stores in 1996.
They were wrong; even though it wasn't an attractive bargain, it lasted 4
more years, an eternity for a 6502-based system. VG and CE were wrong,
or it wouldn't still be at Toys R Us today.

>
> : The fact is that 8 or 9 years after its introduction, I can still buy NEW

> SNES). They shot a healthy system in the jugular.

Evidently they didn't shoot it in the jugular. It was still making profit
at that price point, or it wouldn't have continued to sell for 4 more
years. How can you call it "shooting it in the jugular" (synonymous with
instant death) when it continued on the market for 4 more years? All you
can say is that it wasn't an attractive bargain compared to the 16-bit
systems, but you can't say that it was "shot in the jugular" or "killed"
back then; once again, the fact that it is in stores today disproves
that. Will you not even concede that which the evidence is in favor of?

> The support for the NES
> should have been (and could have been) much greater

Once again, the facts speak otherwise. The NES has been hailed as the
world's most popular video game system, a title once held by Atari's 2600
VCS. It's in stores 9 years after its introduction. Nearly a decade

later, Kay Bee Toys and Toys R Us still have games. How much more could it have been? Will the Jag still be in stores in the year 2002? Is the Sega Master system in stores? Is the Atari 7800? IS the XE Game System? THose are all from the same era and "died" earlier and I think you should speak of those systems the same way.

Sounds to me like you have a grudge against Nintendo. You may freely dislike Nintendo and its practices and games, but please don't ask us to believe that it wasn't a well-supported system; it has been video game of the century worldwide. The facts back this up.

The Super NES had a VERY slim profit margin after the price cut. That was necessary to facilitate competition with the Sega Genesis. Prices and profit margins on CONSOLES are almost irrelevant to the state of the particular platform, because even Hiroshi Yamauchi (pres. of Nintendo) stated: "Forgo the profits on hardware because it is really just a tool to sell software. That is where we shall make our money." Therefore all of this analysis that you're making into the price of the console has relatively little meaning. The price of the actual console hardware isn't necessarily indication of the state of the platform. If that wasn't the case, the NES would have indeed died in 1992, but we all know that wasn't the case since it's in stores now.

James

: Evidently it that didn't kill it, since it's still in stores in 1996.

My locals stores have them too. They've been trying to clear out
the same machines for the last four years.

: They were wrong; even though it wasn't an attractive bargain, it lasted 4
: more years, an eternity for a 6502-based system.

Take a look at what the sales and support were before the SNES
was priced at just $20 more and then look at the same sales and support
after. It's a death knell if there ever was one.

VG and CE were wrong,
: or it wouldn't still be at Toys R Us today.

Why don't you ask your
retailers when they last re-ordered NES's or how quickly NES stuff moved.
Ever think that they might have been trying to clear those things out for
a long time? I can go down to my Toys R Us back home and still buy an
Atari XE Video Game system too ...

: Evidently they didn't shoot it in the jugular. It was still making profit
: at that price point, or it wouldn't have continued to sell for 4 more
: years.

It didn't selll well at all for "four more years." The NES was
discontinued two years ago. Sales collapsed two years before that.

: can say is that it wasn't an attractive bargain compared to the 16-bit

You obviously aren't listening.

: Once again, the facts speak otherwise.

What facts! Look at the number of developers that jumped ship
after Nintendo's move! Look at how the sales collapsed. You ducked this
point several times!

The NES has been hailed as the
: world's most popular video game system, a title once held by Atari's 2600
: VCS.

The sales for both are pretty close. Atari didn't pull some of
the questionable "bully" tactics that Nintendo did, so that pulled
Nintendo ahead.

It's in stores 9 years after its introduction. Nearly a decade
: later, Kay Bee Toys and Toys R Us still have games. How much more could

: it have been?

1) Ever hear of clearence items that won't move? There are so
many NES systems and games around, it will take forever to get rid of
them all.

2) There could have been a lot more support and the phasing of
the NES could have been handled much better than Nintendo saying "Thanks
for making us the king ... now dump our old machine and buy our SNES."

Will the Jag still be in stores in the year 2002?

No.

Is the
: Sega Master system in stores? Is the Atari 7800? IS the XE Game
: System?

See my earlier point about leftover XE stuff being at my Toys R.
Us. Same idea.

: Sounds to me like you have a grudge against Nintendo. You may freely
: dislike Nintendo and its practices and games, but please don't ask us to
: believe that it wasn't a well-supported system; it has been video game
: of the century worldwide. The facts back this up.

Jesus Christ MAN! Did you hear anything I said? Are you freakin
deaf! I never said the NES wasn't well supported! I said that Nintendo's
way of "phasing" it out was really shitty! That has been my point all
along!!!!!!! And yes ... I do hold a grudge against Nintendo. They're
business practices are unethical, their hardware is unninovative and I
don't like the way they death knelled the NES. As you pointed out, the
NES was *HUGE*. Yet, Nintendo all but dumped it as soon as the SNES was
released. Yes, there were new games (but only a tiny fraction the number
their had been) and new machines but Nintendo virtually shot the market
in the head so that they could proceed with the SNES. To give Nintendo
credit, they have made some great games, but I detest the company!

>How many games are available for the VirtualBoy?

At release there were something like 5 games available.

A couple of weeks ago I was in a Toys R Us store (no Jaguar stuff anywhere, naturally) and was interested to see that SEVERAL new Virtual Boy games have been added to the VB section in the video games aisle.

There are now MORE games available for the VB at this point in its market lifetime than there were for the Jaguar at the comparable point in its lifetime.

The VB games area is now about the same size as the Atari Lynx display area EVER was during the entire lifetime of the Lynx.

Your mileage may vary, this is my experience in the store near me.

I'd post this to a Mac advocacy group, but I don't see Peter posting there (he obviously likes to curse the Atari groups) so I'm starting this thread here. :-)

Apple just announced that they have frozen their funding for R&D. How will this affect Copland? R&D is a company's future, seems as though Apple is undermining it's future now! Excellent move by Apple's management, right Petey?

Also, Standard and Poor downgraded Apple's debt rating, which will now make it more difficult for Apple to take on debt. The deal with Sun is snagged now and rumors have it that Apple is looking for other buyout/merge opportunities with IBM or Motorola. Apple's stock fell to a new low. (see http://www.cnet.com)

Can you imagine if IBM, Apple's historical nemesis, were to take over Apple!? It would be symbolic of the ultimate victory for the IBM PC line, right Sinflop? :-)

Looks like really tough times are in store for Apple. Petey has been bashing Atari's mismanagement of products into the grave and it looks like his favorite company is doing the same thing! Apple obviously wants to follow the Atari model of management. GO APPLE!

Eh, Beavis..Apple did not freeze their R&D funding. Apple through MacWeek's
investigation of Apple VP of R&D Nagle's memo did not say that R&D is frozen.
Nagle told his managers to curb expenses in travel, conferences and so on..
OOOPS, I am sure that the egg on your face will peel off..

He he he he he...Atari model of management? You sure? Apple moved volume like
1.3 million units each in the last two quarters. How much volume did Atari
move in the last six months?

Nice try kevinpoop!!

The point is that the NES system lasted a long
time. Of course the grunt of Nintendo's drive
went towards the Super NES to compete with the 16-bit Sega Genesis. I
don't know what point you're trying to make, other than to point out that
the NES "wasn't a bargain" after 1991. It probably wasn't, but it was
(is) still available to those who want one bad enough. Looks like you're
trying to accuse Nintendo of "abandoning" its user base like Atari
frequently does, but the difference is that Atari does it MUCH more often.
I would have thought even a die-hard Atari-only fanatic like you
could be dispassionate enough to admit what is obvious: The NES enjoyed a
long life for a console. However, it appears that all you're after is to
try to accuse Nintendo of "abandoing" its users in Atari fashion in an
attempt to make two wrongs equal a right for Atari - or what is your point?

>

>

My Toys R US was built just in time for the Christmas season '95. I
bought the last NES they had; they couldn't have lasted that long since

the store just opened. If you want to talk about "trying to clear out"
old video game junk, looks like they couldn't even give away XE Game
Systems since I haven't seen them in stores since '89 or '90. Have they
really been trying to dump them for six years? Which store is this??

> : Evidently they didn't shoot it in the jugular. It was still making profit

>

I guess it just proves my point then. They continued to support it for 2
years (since you above say sales collapsed 2 years prior to its
discontinuance) after "sales collapsed." If a console is still supported
for 2 years after sales collapsed, looks like pretty good support to me.
Of course, you'd beg to differ, no doubt. That's fine; we have
drastically different ideas of what constitutes "good support" I see.

> : can say is that it wasn't an attractive bargain compared to the 16-bit
>
> You obviously aren't listening.

No, I obviously disagree and you obviously assume its because I'm not
listening and you're obviously wrong.

>
> : Once again, the facts speak otherwise.
>
> What facts! Look at the number of developers that jumped ship
> after Nintendo's move! Look at how the sales collapsed. You ducked this
> point several times!

I'm not "ducking" anything. What is your point? The system was old and
the money was in the Super NES games, the hot setup at the time. The
developers wanted money and the Super NES was the ticket to hot game
sales - not because the NES was "only" $20 cheaper, but because game
players wanted hot new graphics and sound. What point is there to
"duck?" In fact, what point are you trying to make again; these
arguements are so obvious that not only do I not see what you're accusing
me of "ducking," I don't even know what you contend about the whole
scenario. Please restate it in as few words as possible, as long as
whatever you are accusing me of "ducking."

>
> The NES has been hailed as the

The Nintendo games were also better, which had something to do with it,
or nobody would have put up with the bully tactics.

>

Yes, I've heard of clearance items. I've been buying them lately, very
cheaply, and enjoying them. If (as you indicate above) the TRU at your
locale still has XE game systems, then THAT is an item that fits the
description you give above (more so than ANY Nintendo product).

>
> 2) There could have been a lot more support and the phasing of
> the NES could have been handled much better than Nintendo saying "Thanks
> for making us the king ... now dump our old machine and buy our SNES."

If they continued to support it for 2 years after "sales collapsed" as
you said earlier in this message, I don't know what you expected. It was
time to move to the SNES, and that was where the money was. Sorry that
you can't understand the eventual need to upgrade, but:

1) Eventually, there is a need to move to next-generation system.
2) The NES had a _very_ long life before "upgrade time" came
3) Nintendo continued to support the NES for years after "upgrade" time
4) I don't know what point you are trying to dispute.

> : Sega Master system in stores? Is the Atari 7800? IS the XE Game

Settle down, Beavis, it's only ASCII. Earlier in this post you say that
"There could have been a lot more support" then you say (above) that you

didn't say this. You are contradicting yourself.....and you swear at me???

> I said that Nintendo's
> way of "phasing" it out was really shitty! That has been my point all
> along!!!!!!!

But gees....you admitted that after "sales collapsed" they continued to support it officially for two years. What more did you want? Should they have paid buyers $100 to take off their hands? That has been your point all along?

> And yes ... I do hold a grudge against Nintendo. They're
> business practices are unethical, their hardware is unninovative and I
> don't like the way they death knelled the NES.

Their business practices may have been "unethical," but you must be a communist if you think business is run for some other purpose than for profit. Whether or not their hardware is "uninnovative" is a matter of opinion, but the 8-bit NES has better graphics and sound than any other 8-bit game system (including XEGS and 7800) and the 16-bit Super NES has better graphics and sound than any other 16-bit system. So I guess that's your basis for it, then; you think graphics and sound have nothing to do with innovation in video games. You must be a die-hard Atari fanatic, which would explain everything. Likewise, continuing to produce and support a system two years after "sales collapse" is a "death knell" by your (il)logic.

> As you pointed out, the
> NES was *HUGE*.

Must have had something to do with all that "uninnovative" hardware and "unethical" business practices.

> Yet, Nintendo all but dumped it as soon as the SNES was
> released.

Once more.....you said yourself that it was continued for 2 more years after "sales collapsed."

> Yes, there were new games (but only a tiny fraction the number

: Ok, so we agree, then, that the NES is still in stores 8-9 years after
: intro to the U.S.

We agree, though you're definitely missing my point. Yes, it's
still in stores but the fact is that many stores could not get rid of the
thing.

: The point is that the NES system lasted a long
: time.

Yes. However, Nintendo shot it in the head as soon as they
released the SNES. They could have (and should have) given more support
to the older machine considering how huge the market was.

: I would have thought even a die-hard Atari-only fanatic like you

Now you're being an imbecile. If you knew anything about me,
you'd know that I've owned Sega Master Systems, an NES, a Genesis, a
TG-16 as well as Atari products. I'm also a big fan of the 3DO and
Playstation.

: could be dispassionate enough to admit what is obvious: The NES enjoyed a
: long life for a console.

The NES could have enjoyed a longer life.

However, it appears that all you're after is to
: try to accuse Nintendo of "abandoing" its users in Atari fashion in an
: attempt to make two wrongs equal a right for Atari - or what is your point?

My point is this ... Atari generally drops products when people
are no longer interested in them. Nintendo forced people to move from the
NES to the SNES by pricing the two machines to within $20 of each other.
The NES was (at that time) the hottest selling toy.

: Systems since I haven't seen them in stores since '89 or '90. Have they
: really been trying to dump them for six years? Which store is this??

The store is in Ottawa. They also had some Sega Master system
games, the last time I was there.

: I guess it just proves my point then. They continued to support it for 2
: years (since you above say sales collapsed 2 years prior to its
: discontinuance) after "sales collapsed."

A bare smattering of support. The NES had tons of games being
released before the introduction of the SNES. When the SNES came out,

virtually all support stopped. How many games did Nintendo release?

: Of course, you'd beg to differ, no doubt. That's fine; we have
: drastically different ideas of what constitutes "good support" I see.

We do. My problem is that the NES was extremely popular and yet
Nintendo drop kicked it.

: I'm not "ducking" anything. What is your point? The system was old and
: the money was in the Super NES games, the hot setup at the time.

The NES was still the hottest toy around. It was going very
strong. Nintendo drop kicked it.

: The Nintendo games were also better, which had something to do with it,
: or nobody would have put up with the bully tactics.

I agree partly here, though Nintendo's "quality control" is very
questionable in my opinion. There were fewer duds, but Nintendo didn't
police the "quality of playability" as many would have you believe.

: If they continued to support it for 2 years after "sales collapsed" as
: you said earlier in this message, I don't know what you expected.

Again, (and for the last time) the NES was a humungous hit. Sales
were still astronimical when the SNES was out. Support was also
phenomenal. Yet Nintendo drained all that by lowering the price of the
new machine without also reducing the older one.

It was
: time to move to the SNES, and that was where the money was.

The NES (at that point) had a userbase of 35 million users and
was still going extremely strong. The money was on the NES.

: Settle down, Beavis, it's only ASCII. Earlier in this post you say that
: "There could have been a lot more support" then you say (above) that you
: didn't say this. You are contradicting yourself.....and you swear at me???

You accused me of saying that the NES was never well supported.
It was all the way through it's life ... until Nintendo released the
SNES. Then they killed it. My problem with Nintendo is that they suddenly
(and unceremoniously) dropped such a huge machine. Yes, there were a
couple of games. But considering how big the NES was and how well it was
selling, they should have done more.

: Their business practices may have been "unethical," but you must be a
: communist if you think business is run for some other purpose than for
: profit.

Businesses are run for a profit, but there are also racketeering
laws to protect companies from monopoly practices (which Nintendo was
infamous for). I did my OAC Economics paper on the topic and we can
debate this if you like ((though let's take it to E_Mail).

Whether or not their hardware is "uninnovative" is a matter of
: opinion, but the 8-bit NES has better graphics and sound than any other
: 8-bit game system (including XEGS and 7800)

1) The Atari 7800 had worse sound than the NES, but better
graphics capabilities. It had five times the number of colors, higher
resolution and could put twice as many colors on screen. It also had
sprite hardware which absolutely destroyed the NES. (ie. I've seen 7800
games with dozens of sprites on screen and no flickering whatsoever).

2) If you think the NES had better graphics and sound than the
Sega Master system, you really are smoking something. Take a look at the
SMS version of Mortal Kombat II and then try to tell me which machine had
the best graphics.

3) The Super NES does indeed have the best graphics and sound of
the 16-bit systems. However, it came out two years after the Genesis.
Sega did the ground-breaking work in that arena ... all Nintendo did was
improve slightly upon the Genesis. Two years is a LONG time in the world
of electronics. The fact that the SNES design was all that Nintendo could
come up with in two years is a laughable joke. The SNES has some nice
games, but the system susre isn't innovative.

: to do with innovation in video games. You must be a die-hard Atari
: fanatic, which would explain everything. Likewise, continuing to produce
:

Take another look at my previous comments before making such an
assumption. If I was such a "die hard Atari fanatic", I wouldn't own
other systems and I wouldn't be as critical of Atari as I am. Are you
such a die-hard Nintendo fanatic that you can't accept Nintendo's faults?

: Must have had something to do with all that "uninnovative" hardware and
: "unethical" business practices.

The unethical business practices did have a lot to do with the
high sales of the machine.

Well said, Mr Good;
I am, sadly, a former Atari user. I bought 3 different Atari computers (for music applications), and really enjoyed them. However, after I spent big bucks (for me) on a Falcon, Atari pulled the plug on all their computer work. Everyone here's heard it all before.....
I'm beyond flaming Atari- what's the point? It's too bad, though; I was a big booster. But I got tired of driving 50 miles cause all the dealers dropped Atari, and I got tired of software companies going out of business or dropping support for the platform. Hey, I just couldn't see spending any more money on a dying computer.
I might've hung in there, if it hadn't been for the way Atari screwed their customer base, the third party developers, and their own dealers. Absolutely no sense of commitment to people who'd spent years making the Atari platform viable. I remember reading the press releases for the Falcon when it came out- all that nifty stuff "coming real soon": the DSP modem, onboard video, voice recognition.....with no app.s at all! They just expected everyone else to make their computer do all these great things with no help. They would announce a "product" or application and then it never came out! One time I posted a message questioning this approach on Genie, and an Atari rep actually answered me! He said "just because we announce a product in no way obligates us to release it"
Well that's about it in a nutshell, I'd say.....

Not to nitpick but I'm pretty sure the processor in the NES was the 6809
not the 6502. (same processor as was in the Atari 8-bits' floppy drives
(at least the Percoms). :)

I could be wrong.. my memory isn't very good (got one o' them
simm-verters but it hangs too heavy in the slot and doesn't get a great
connection :)

Was it possible for Nintendo to sell the NES for a lower price without
taking a big loss? I'm an idiot and know nothing about such things, but
I wonder if the old NES cost as much as the SNES to make. The old NES
is a nightmare in some ways, it's nowhere near as simple as the SNES.
I guess this is why the new NES came out. The SNES had to go down in
price because of the price war with the Genesis, which was doing okay
with Sonic looking better than Super Mario World (but not playing as
well).

One of the cooler things Nintendo did for NES fans was redistribute
some of their cooler games like Final Fantasy. I can go into any
Kaybee and find Final Fantasy, Zelda, Punch-Out!! and Metroid. I'm
actually thinking about buying an NES to play some of the games I
missed like Final Fantasy and Crash and the Boys' Street Challenge.

> The number is *VERY* small, especially considering this is a
> Nintendo machine.

It is, I mean this is Nintendo so you except some original game to
be on it! Of course it needs an RPG too but it doesn't have one.
No Nintendo classics like Zelda or Metroid either. Forget it for
now! Hopefully NOJ's president will successfully reintroduce it

with some good software. Some new games are Waterworld, which should suck because it is an Ocean/Acclaim game, Jack Brothers (originally Devil Busters from Kemco), and a Bomberman/Tetris game from Hudson. No RPGS! I'd love to play an RPG on this system. There's a new shooting game too. You're absolutely right about the lack of software on the Virtual Boy, you expect Nintendo to be able to make it a decent system on their own by putting their in-house developers to work on it.

By the way the Jaguar relatively well at the Wal-Mart around here; it's titles now occupy as much space as the 3DO and Playstation. The SNES still rules the shelf space though. I think the cheap price for the Jaguar worked! I'd like to see one but none of the games interest really interest me. Well, Temepest 2000, but only sort of. The Jaguar needs a Blockbuster deal like the Virtual Boy.

OFFICE MEMO
Date:1/18/96

SPINDLER CALLS IN AIR STRIKE, DESTROYS APPLE TO SAVE IT

Stock Price Increases 50%

"We'll do it better," Says Microsoft

CUPERTINO, Calif. ------- JANUARY 18, 1996 ------
The massive pile of smoking rubble near Interstate 280 here in Cupertino was not the result of an earthquake or natural gas explosion, as officials first believed.

It now appears that the terrific explosion and fire at Apple Computer headquarters was the result of the first corporate-initiated airstrike on U.S. or California soil in U.S. history.

Sources within Apple have told newspapers that, in an effort to save Apple from an internal coup that would result in the breakup and sale of the company, embattled Apple CEO Michael Spindler called in elements of the California Air National Guard, based at Moffet Federal Air Station in Mountain View, Calif. to bomb and strafe his own headquarters.

Spindler allegedly called the California Air National Guard late last night and ordered the airstrike, using an Apple Macintosh Quadra A/V with experimental sound cards to simulate the voice of California Governor Pete Wilson.

Within Apple, Spindler is seen as a hero. "Cool! He called in an airstrike on his own position to save his company," said one internal Apple applications developer, who gave his name as "Scooter." "It was like one of those cool movies about, like, you know, Viet Nam, that I read about it on the Web, dude."

A memo to key staffers, reportedly written by Spindler himself, explained the need for the sir strike to counter moves by Apple managers and board members to oust him in a corporate coup and to simultaneously increase the company's marginal revenue. "Existing Macintoshes, both those in use and those in warehouses, will instantly become collector's items and therefore increase dramatically in value," according to the memo, which went on to explain that "this action will therefore increase our margins on existing stock with no cost to our sales and manufacturing operations." Spindler, said to be ailing, is in seclusion. Attempts to reach him by phone mail and fax were unsuccessful.

Apple stock shot up 50% on the news, as Wall Street apparently agreed with Spindler's strategy. "Blowing up his own headquarters was a stroke of genius," said one Wall Street analyst. "This is the kind of pure creative, self-destructive genius we used to see when Steve Jobs was at Apple. It's like the old days. Mac is back!" Overall, computer stock

stocks rose 75% as a result of the Apple news, then plunged 80% later in the day on rumors that Dan Dorfman had been seen having lunch with Jim Clark and Marc Andreeson.

The Spindler airstrike memo, obtained via Internet e-mail by this reporter, was fragmented and missing key information. Apparently, the strike was planned for January 1, but key aides to Spindler did not receive the e-mail until yesterday due to routing table buffer problems and addressing errors.
calling the air strike "an unfortunate incident that, while we hope we any race, creed, color, religion, thought process or emotional state, and we must emphasize that the City of Cupertino had no role in this incident if it did." Class-action lawsuits against Apple and the city, alleging emotional trauma resulting in a lost train of thought, loss of computing resources and interrupted Internet access have already been filed in California State Court.

Later, when told by federal officials that the city will qualify for both federal disaster relief funds and labor department funds for unemployment and job training programs as a result of the destruction, Mayor Bob Mellow said, "Cool. We applaud Apple and Mike Spindler for having the vision and courage to take this decisive action, and hope that our earlier statement was taken in the spirit in which it was meant."

In Redmond, Wash., Microsoft announced plans to build and detonate several networked low-yield nuclear devices at its own headquarters some time in 1997. "This is a project we already had underway," said a spokeswoman for Microsoft chairman Bill Gates. "We just decided that the marketplace won't be ready for it until 1997. Or 1998, if we decide that's when we really want to do it. Or maybe later. Right now, we're hiring additional staff, developing new technology and getting ready to copy Apple's idea, strategy and execution. Oops, I meant to say that we're evaluating previously extant competitive actions." The project, dubbed Curtains `97, is expected by analysts to be complete some time in 1999.

Apple announced it will sue Microsoft in federal court over the "look and feel" of the use of explosive devices in business and home computing product strategies.

>1.3 million units each in the last two quarters. How much volume did Atari
>move in the last six months?

Still trying to wipe egg of your face? As a proportion of the company's
wealth, I'd say that Atari is shipping more volume than Apple right now:

Apple value $8 billion / 1.3 million = $6153 per unit of volume shipped
Atari value $100 million / 200,000 = $500 per unit of volume shipped

Numbers that don't mean anything in reality, but still prove my point.

How do you like them Apples, Sinpoop!

With a new CEO from National Semiconductor who turned around that firm three
years ago, Wall ST will give Apple breathing space. Considering that Apple's
new Chairman and CEO Gilbert Amileo is highly regarded and supported on Wall
ST..

To bad Atari can't jettison the Tramiels..

What this means is that Apple will be reorganized in much the same style
as NS was - retreating to key markets and building up there. Thus, Macintosh
will become what Mac critics blast Amigas and TOS machines for - niche boxes.
Macs will serve DTP and education, and pull out of corporate markets, where
they've been sagging for years. Low end will eventually go as PC prices
collapse, replaced by other firms. In short, Apple and MacOS will be less of a
all Street - the samer
folks whop put Chrysler in the hole THREE times in the past twenty years, and
are now complaining about Chrysler's large cash reserves, despite the fact
that sales have doubled over four years, and profits this year will be HIGHER
than Ford's (who is doing roughly double the sales volume). Apple's cash will
be parceled out to satisfy investors, and it will be sliced and diced,
shrinking. When it eventually
meets financial hardship, its cash will be in shareholders' packets rather than
in the bank, and Apple will equal Chrysler 1981. But this time, the
government won't bail it out.

A couple points:
1) Most folks here don't care about Atari - we care about the machines and
software. Atari gave up on those. In order to rile us up these days, you
should attack C-LAB and software designers (something you would probably not
do, since you know nothing about either).
-
2) You have yet to respond to my message outlining all of Apple's current
woes. These are all factual bits of info, that together, paint a less than
rosy picture. Oh, man, doesn't it _SUCK_ being on the receiving end? Now
Mac users know what it's like to be ambushed by ignorant scores of users
of a larger platform when troubles pop up! How's it like? Will TOS and
AMiga users receive any apologies, though? I doubt it. Mac users will simply
continue to call upon Guy Kawasaki and other spin-jobbers to put a far better
veneer on a bad situation than anyone in Amigadom or TOSland ever could.
The more things change, the more they stay the same.

BR Miller
Boston, MA

From: goos@badlands.NoDak.edu
Message-ID: <4f0ql0$af0@daily-planet.nodak.edu>
Source record: 10423

The online service GEnie was long a stronghold for the Amiga and Atari communities. Recently, it seems that GEnie has been sold by General Electric to new owners. The first official act of these new owners apparently was to double the minimum monthly connect fee to about $20 a month.

I cancelled my GEnie subscription the day I heard of this change. Access via Sprintnet was impossible after 5 PM. I've been forced to use an old 2400 baud GEnie line for several months. I wasn't willing to pay almost $20 a month for an online service accessible only at 2400 baud.

It seems like lots of GEnie subscribers are going to bail out in the next month or so. I'm sure this will affect the Atari community, as these users will be looking for different online services to use.

Where have you been? The Mac has been a niche platform for the last 12 years.
And don't compare C= and Atari to the Mac. Both machines never sold in the
volumes to support their developers and none of them updated their products in
a timely fashion.

I don't know about the lowend, but Apple will bring out new Performa(s) this
week..

Plus Mac clone makers will drive more of the market this year..

Apple and the MAC is obsolete and out of style. MAC is a loser machine and
everyone knows it. Lets see, there is no quality, no software and higher
prices. Wow no bargains here. System 7.5 will be nothing but an operating
system for set-top boxes, watch it happen, you will see what I am talking
about. With Windows 95/NT out, its over for apple. I am no Atari fan either,
but for a person that always puts down other platforms, its more like egg on
your face. Its like a person with a Coleco Adam, putting down Amigas because
they are obsolete. The person with a Coleco Adam, is you.

The Mac will become, simply, not a machine for general user, but a machine
for tiny niches. The Mac userbase will shrink. Mac won't be an alternative
anymore, merely a required evil in certain small circles.

>And don't compare C= and Atari to the Mac. Both machines never sold in the
>volumes to support their developers and none of them updated their products in
>a timely fashion.

Nonsense. Both machines have sold millions of units, and developers have and
still continue to develop applications for them. As for "updating products,"
it seems to me that Apple was playing catchup - Atari and Commodore didn't need
to develop as quickly, since their competition for years was a 128K B/W Mac.

>And don't compare C= and Atari to the Mac. Both machines never sold in the

Commodore and Atari were both non-mainstream computer makers. So is Apple.
All three had problems arising from the "PC-ing" of the marketplace. Size,
here,
Peter, doesn't matter (bet that releives you a bit).

>> meets financial hardship, its cash will be in shareholders' packets rather than
>> in the bank, and Apple will equal Chrysler 1981. But this time, the
>> government won't bail it out.
>
>He he he he he..Evidence please..

Wall Street typically does not look at long-term results (especially in the case
of Chrysler). Turnaround "gurus" usually slash and burn, paying out huge
amounts
of cash to shareholders, decimating expenses like R&D, and leaving before anyone
notices what happened. If Apple is hiring a "turnaround specialist", it mean
s that Apple believes it's in trouble, and has given up on a growth strategy.
Now, the goal is simply to survive and appease Wall Street. Wait and see,

Peter.

>No C-lab machines in my lake of the woods..

Doesn't matter to me, there are no Macs in my neck of the woods either - most everyone I know who doesn't use PC uses Atari/C-LAB machines (and they're all business majors like me). I also know a few Amiga people, most of whom bought A4000's to switch from B/W Mac boxes. Frankly, I think Boston is a bit more important on the industrial scale than central Iowa, but that's just me. . .

>> AMiga users receive any apologies, though? I doubt it. Mac users will simply

>> The more things change, the more they stay the same.
>
>Receiving end? The difference is Apple sold in volume while C= and Atari did
>not..

Again, this is pure nonsense. If millions of machines isn't "volume," what is? Also, volume doesn't equal profitability. Commodore and AST sell record levels of machines, yet still lose bucketloads of money. Commodore ended up paying the ultimate price. And no matter what spin you like to put on the Apple situation, the fact is, as it stands, Apple is not currently able to sell in volume profitably. This problem is the same that plagued Commodore. While you obviously
want to ignore thiis reality, it exists, and has finally come to manifest itself in financial results. Take a look at the reports, learn some accounting (financial and managerial), then come back and tell me that "everything is OK."

PC Week just reported that Atari will make an announcement that they may leave the video game market and concentrate on the PC gaming market. However, Atari is sitiing on a huge inventory of unsold products..

Hoff was fired along with 20 of his people last month. He is quoted by stating that by Christmas 1996, will only be Sony and Nintendo left..

So el-Travy what do you have to say about this?--->

So, you've finally realised why people buy PCs and Amigas. To play games.

Meanwhile, those of us with work to do, carry on doing so with our Ataris,
Macs, BeBoxes, Alphas ...

And we get a lot more done in shorter time frames than other
pseudo "serious" hardware.

They were in New Hampshire as well (and actually first) due to primaries. Does
this mean New Hampshire is more imporatn industrially than Massachusetts?

>What are you talking about? Apple cleared $425 million in earnings after tax

Peter, quite simply, operating expenses exceeded revenues. While cash flow was
positive, this effect only lasts for awhile - if losses contionue (and expand),
and are not due primarily to amortization of inventory and depreciation, the
result will be negative cash flow, and eventual insolvency. Apple's balance
sheet looks decent now, but there's no question that it has materially
deteriorated
(check that little item called "retained earnings" in the SE section for
evidence of this).

Brian,
You're right that Atari has no plans to update their computers (I suppose that it is possible that Jag 2 will surface but I highly doubt that). On the other hand, Atari clone makers seem to be working hard on bringing new innovative products to market. There are many nifty accelrator cards for my Falcon and C-Lab just released a new version of the Falcon (the MK-x). Computer Direct in Canada has a TT-030 clone that is reasonably priced and in a tower case. Many people are improving MultiTOS (preemptive multitasking) on the net and commercially. Rumors have it that C-Lab is even completing TOS 5. So the Atari market is far from dead. Atari might be. Just some interesting tidbits from the Atari world.
I hope the Macinstosh platform continues, btw, as I think it is fairly nice. I just enjoy TOS/GEM more. So, please don't take this as a flame (sometimes I think it is assumed in this group).

I seriously doubt that Sega will be out of the picture. I'm sure nearly
as many Genesis systems sold as Super NES this past Christmas (in other
words, a butt-load). The Saturn has been off to a slow start, but I
doubt Sega's throwing in the towel just yet. The 32x will probably die
sometime this year. They never should have come out with it. I'll bet
they'll be giving 32x units away soon, as they dump inventory.

>tidbits from the Atari world.

Good to hear those tidbits, especially since I'm an active "citizen" of
that world. Atari Corp. is irrelevant to TOS, it has been for two years.

>I hope the Macinstosh platform continues, btw, as I think it is fairly
>nice. I just enjoy TOS/GEM more. So, please don't take this as
>a flame (sometimes I think it is assumed in this group).

So do I - why would I take it as a flame?

I was at my local Babbage's last week, and I noticed something really funny.

The Mac software display had always been on the back wall of the store, in a display about 4 feet wide. Well, at my last visit, I noticed it wasn't there anymore.

I started looking around. No Mac displays on the walls. Then I looked right behind me.

On a small end-cap of the back "island" display was located the "Macintosh" software section.

The Jaguar display, located on the wall by the front counter, is LARGER than the Mac display!!!

The PC software displays have replaced the original Mac section, and now the Mac presence at Babbage's is pathetic. But stores such as this will prioritize their shelf space according to what is generating the money, and it's obvios that the Mac software isn't doing that.

On a similar note, my local Best Buy has cut a shelf on it's Mac display and devoted it to PC and Mac books.

Your market is shrinking, Peter. And Apple's current problems are definitely not making matters any better.

The bad news is the rate is going up to approx $20 per month. The good news is that includes 9 free hours. I believe that for an additional $9 you can also have a SLIP/PPP account with unlimited Internet hours. I'm not so concerned about the extra $$$ as I am with the fact that GEnie has been slipsliding fast, losing subscribers like rats off a sinking ship over the last 18 months or so until now it seems only a shell of its former self. With GEnie dying and Atari dying I am being forced to grow up and get a life! :<

>But very few people seem to understand the hype behind RISC chips. Their
>only two advantages are their minimal instruction libraries and their
>ability to run cooler at higher speeds. However, for complex instructions,
>CISC can sometimes beat RISC outright.

RISC has nothing to do with running cooler at higher speedsm and RISC computers don't have instruction "libraries," they have instruction sets. You are correct in saying that in some instances CISC can sometimes beat RISC outright, but the performance of a processor has to be evaluated on an holistic basis.

Any processor executes instructions by performing a series of steps. So we can express the time required to perform a given task in the foorm:

Execution time = N * S * T

where N is the number of instructions
S is the average number of steps per instruction
T is the time needed to perform one step

In general, CISC machines attempt to decrease the value of N and RISC processors attempt to reduce the values of S and T. Pipelining can make the effective value of S very close to 1, which means that most of the time the computer can complete the execution of one instruction in every CPU clock cycle. To reduce the value of T, the clock period, the number of logic levels in the hardware that decodes instructions and generates all the internal control signals must be kept to a minumum. This means that instructions should be kept simple and small.

CISC proponents claimed that availability of complex instructions simplifies the task of designing compilers and leads to an overall improvement in performance. The RISC philosophy evolved following a number of studies which examined the way high-level language compilers use the instructions of given machines. The studies showed that the complex instructions that perform specialised tasks tend to appear infrequently, if at all, in the code generated by compilers. Although such instructions are useful for programming in assembly language directly, they are much more difficult to generate automatically by a compiler.

The term RISC was first used by researchers at Berkeley who developed a processor with the same name. Its instruction set consists of instructions that are easily used by compilers and that can be executed at a high rate using techniques such as pipelining. RISC instructions perform simple, basic operations and use a small number of addressing modes. Access to memory

is usually limited to load and store instructions. Floating-point operations are also typically provided as an integral part of the instruction set.

The execution speed of a RISC machine comes at the expense of increased compiler complexity and compilation time. Also, the size of the machine code needed to perform a given task may be much larger than the code for a CISC machine. What's really interesting is that it has been proven that a SISC computer (Single Instruction Set Computer -- ie, a computer with only one instruction) can perform all the tasks any RISC or CISC computer can.

Well, I do think it is a tongue-in-cheek stab at the "1984" commercial Apple
did to introduce the Macintosh. I admit it is somewhat obtuse humour, but
pretty cheeky, indeed. Check out the QuickTime movie on ORST [er, peak.org]
for reference.

"We are one people, with one will, one resolve, one cause...
...our enemies shall talk themselves to death, and we shall bury them with
their own confusion. And we shall prevail..."

Cool spot. Only aired once. Leni Riefenstahler would have been jealous.

For whatever it was worth.

Speaking for myself, I buy mailorder from MacWarehouse, MacZone, and
MacConnection. I have yet to buy retail because of the huge price
descriptancy.. Every three weeks I receive new catalogs that are fat from
those mailorder place..Plus, no tax is charged. This maybe true for many Mac
people as well.

> On a similar note, my local Best Buy has cut a shelf on it's Mac

And sales are up...Plus PowerComputing are having bang bang sales on their new
line of PowerCurve and PowerWave machines. My dept. put in a order for macs
today. My interactive video class in the center for education technology
recieved their 19 PowerBook 5300's...

Apple's new management is stabalizing the situation..And understand to convey the PR message with weekly ads in the major newspapers like the one today..

To bad, Atari can't change their management..

With new management that is bringing stability, I doubt Apple will ever become Atari-like state. There still is huge demand from the loyal base.

Obviously, you're not a musician.

I do multi-media production at work using a Pro Tools III system, with TDM plug ins,
8 bus Mackie board, PPC8100/100 with 128 megs of RAM.

I do music production at home on my Atari Falcon with Cubase Audio.

Pro Tools III: 16 track playback out of 8 outputs, MIDI file playback, TDM,
8 track simultaneous record. Price: around 7k, plus computer (yours isn't good
enough, you need at least 2 full-size nubus slots), $1500.

CLab Falcon/Cubase Audio: 16 track playback out of 8 outputs, complete MIDI
editing and processing, no TDM :(, 8 track simultaneous record through ADAT
digital interface. Price: around $600 for software, 1.7k for the machine,
another grand for interfaces, etc, and you still come out way less than half the
price.

The Falcon's no where near as fast at calculating waveform overviews, and it's
not as quick at most things, but there's nothing else out there that performs
as well for less than double the price. I can't afford a Pro Tools system. I
love my Falcon.

No one computer can do everthing best, face it! It is IMPOSSIBLE for your Performa
to meet the music production capabilities of my Falcon, including inputs and
outputs.

-Mark

Scott,
Thanks for you post. Most posts aren't this pleasant to read even then they express an agreeing opinion. But I beleive that creating Atari clones with better 68K hardware is almost self-defeating. The fastest 68060 isn't competitive with the Pentium Pro and MPC604 boxes that Compaq and Apple are shipping today and 68K machines can only continue to fall behind. MultiTOS is also a nice OS. My philosophy is to grade an OS in three ways: fundamentals, interface and API. The fundamentals are the base that the operating system functions on. A distributed, kernal based, preemptive, protected, VM, virtual address space operating system would do well here (ie Mach). The interface category is subjective but self explanatory. The API represents the robustness of OS calls that the OS provides. MultiTOS certainly has better fundamentals that W95 or MacOS except for VM. It's interface is arguably (though I disagree) better. But it lacks some of the technologies that PC and Mac users want. It has no support for component (document) architectures, it has no standard 3D API or metafile format, there is no standard scripting achitecture, no do-it-for-me help system and no stardard method of color synchronization. I'm sure that other technologies are missing as well. Combine that with Atari's disinterest in developing these technologies and the fact that MS and Apple probably coudln't be convinced to extend their techologies, it would seem that Multi-TOS can only fall behind. Of course, if you have a Falcon now and like it, don't bother to switch or anything :)

:
: Is this VHS/BetaMAX fate again? Haven't you learned anything from the
: past?

Well, one thing I learned from the past is that about 60 million people
died in world war two, while the number of people who died in VHS/Beta
wars can probably be counted on two hands (a few Wall Street brokers who
made the wrong prediction and took the Window exit).

I have to agree that comparing Bill Gates to Hitler is rather stupid,
bad taste and completely uncalled for!

See Windows can be dangerous :-)))))

Sorry, the original black humour I thought was funny, but I
think this now is getting silly.

I think we all know what Hitler did and what sacrifics were
made to remove him, if not go see Schindler's List (should
be compulsory for all). On the other hand, it is known
that politicians knew of the persicusion of the minorities
in Germany long before WWII. So it pays to be vigilent.

No I don't think Bill Gates is the next Fuhrer, but some
companies are now more powerful that countries.

We all know how easily politicians slip into the pocket.

Anyway back to purpose of this group, mines
bigger/better/faster that your's and you smell ;-)

Andy.

> PC's? Just say whoa! :)

Ahhh.. your statement brought a tear to my eye. :)

GEM makes Windows 95 look hysterically bloated... I have really fond memories of the Atari ST. I used it to: call a BBS for the 1st time, get addicted to my first computer game (Dungeon Master), and just generally get hooked on computers. This was when I was 11. Now, I'm almost 22, and am 8 months away from my M.I.S. degree, just because of that machine... I wish I still had one...

Big C= only make C=64 as as sub. of Escom, assuming their plans worked. Amiga Tech now is in control of Amiga, also sub. of Escom. The only (major) future plans for Amiga from what I have read is
1. PPC Amiga
2. Porting of Amiga Workbench to other platforms.

Atari no longer supports their home computers, a some German company does.

For a long long time. And I usually don't ever bother about bad taste,
I just kill it. But being a German, I always get a bit touchy when
somebody thinks it's funny to throw Nazis or Hitler or the Third Reich
or concentration camps or.... around. All that stuff is WAY to serious
to be made fun of.

How would you react to a joke being made about the glorious defeat
of the ANZAC corps at Gallipoli(sp?)? One along the lines of "yeah,
the Ozzie cricket team are such wimps, they don't go to Colombo to
avoid having their ass kicked by the Turks, like they always did,
even back at Gallipoli". Not very funny, is it?

> So, you've finally realised why people buy PCs and Amigas. To play games.

Umm.. I don't know where you get this from. The Amiga has been instrumental in my company for tech support of different platforms due to its amazine ability to emulate other systems (we have very small tech support lab). Also, our PCs running SCO, Solaris, UnixWare, and NT are doing things that Atari Systems are currently simply unable to do. BTW, none of my systems, except the NT server, has games in it.

> Meanwhile, those of us with work to do, carry on doing so with our Ataris,
> Macs, BeBoxes, Alphas ...

Explain work to do with Ataris... There are NO software or emergency support for Atari systems. BTW, BeBOX is not released, is it? Alphas are nice, but it was not until Version 3.2 of DECunix before daily reboots are eliminated. And Macs... well it is nice for beginners, I'll grant that.

Memory-to-memory subtract and branch if result negative. It's not a
practical architecture for a whole slew of reasons, but it still is useful.

If you mean for the ST line I do not know. However, MacWarehouse has PowerMacs
6100/66 8-500-cd for $1099 and the 7100/80 8-700-cd for $1299. I am most likely
will get a 7100 since my 636 has been sold..

: >
: > Hoff was fired along with 20 of his people last month. He is quoted by stating
: > that by Christmas 1996, will only be Sony and Nintendo left..

: I seriously doubt that Sega will be out of the picture. I'm sure nearly
: as many Genesis systems sold as Super NES this past Christmas (in other
: words, a butt-load). The Saturn has been off to a slow start, but I
: doubt Sega's throwing in the towel just yet. The 32x will probably die
: sometime this year. They never should have come out with it. I'll bet
: they'll be giving 32x units away soon, as they dump inventory.

: James

Sega Of America's Chairman stated that SOA is looking at the same
road Atari is; the software-for-PC route. From his last interview in Next
Generation Magazine, he didn't sound very confident of the Saturn's
overall success in the future. He cited it costs more to manufacture a
Saturn console than they are selling it. (A big loss in the long run).
And, since it costs less to manufacture a Playstation, and Nintendo will
introduce its Nintendo 64 console at $250, Mr. Kalinske admitted it will
be very hard to keep up with price drops in competing in the market.

Tell ya the truth, I never liked Sega's home division anyways. The
arcade games are near-perfect fun, but the home stuff gotta go.

(BTW, as an Amiga user, I sympathize with all Atari users. Seems like
Irving Gould/Mehdi Ali had even more evil dopplegangers running Atari.)

> still could make refinements after disassembly to make it even better.

Good compiler, but sadly lacking in the integration of editor, compiler, linker, librarian tools. But, as a 1985 compiler, it was quite good.

Megamax released Laser C, of which I received a "scurrilous" copy. I like it, so went to a shop with cash in hand to buy it. Some &*!*^ had walked off with the discs for it. (I got the manual for nowt as they were closng out of Atari stuff). I couldn't find anywhere in the mags selling it, so I bought Lattice C direct from Hisoft instead. [I have destroyed my copy of Laser C]

> Now I'm working on a PC under windows 95 and I can't believe the kind of
> waste in this system. Wasted memory, sloppy coding, excessive repetition
> of routines.......the list goes on.

Scuttlebut says that memory/drive manufacturers give Microsoft a kickback for making Widows slow and bloated, so people need to go out and buy more memory and disc.

In essence its a "my yingyang is bigger than yours". If your software only uses 350k of disc and 128k of RAM, it must be very bad, as product X uses 231 Mbytes of disc and 19.4 Mbytes of RAM.

> I wonder how big the hard drives are going to have to be when these people
> reach the peak of programming laziness.And also how slow the programs are
> going to be. Or maybe we'll make yet another microprocessor to go faster
> so we can waste even more space.

Dont forget, a Microsoft/Intel computer is a "real" computer, and anyone with anything else is obviously using a toy. A computer with less than 8 megs of RAM aint a real computer. And as for hard drives, one gigabyte is for sissies - we use half terabyte drives (which are already feeling a bit cramped), so everyone else has to use the same too.

But then of course, we dont need to replace our computers every eighteen months. A nine year old 1040ST will still do most things anyone wants - but a nine year old PC-AT will not.

> I also can't understand how a company like microsoft can get away with
> making an operating system that takes as much as 2.5 minutes to oad into
> my computer???????????

Coz billions spent on advertising/mind-control has an effect on sheep.

Free thinkers using alternative systems and hardware are thankfully immune to this "Bill Gates Is God" and "Microsoft Can Do No Evil" brainwashing.

And long may that continue...

I have to say that you really need 16 megs and a gig hard drive. Data still
takes space no matter how tight your programs might be.

>Oh, really and what evidence do you have? How can the userbase decrease when
>Mac sales are suppose to increase by over a million from last year?

Irrelevant. PCs sold faster than television sets last Christmas
season. Mac sales of 1 million are a drop in the bucket.

>The entire installed base of the Atari ST line is between 2.5 - 3 million units
>while the installed base of Amigas are around 5 million units..The installed
>base of Macs are over 22 million units..

Once again, irrelevant. The installed base of PCs numbers over
225 million! Apple's competition is the PC market, Peter. The
fact that you compare the Mac markets to the ST and Amiga markets
underscores how much of a niche the Mac market has become.

>For years that the Mac 128k existed? The Mac 128k went out of producution in
>mid 1995 and replaced by the Fat Mac 512k. The Mac II did not come unto the
>scene until early 1987..

Yeah, and it's initial price was $3900. You could buy a 1040ST for
$1000 back then. This just illustrates how underpowered and overpriced the
Macs of yesteryear were. The price points of the Amiga and ST machines
in the mid-late 80's blew away Apple's pricing.

>Well see..Apple hired a CEO with a proven track record for turning a firm
>around and growing it.

You won't admit that Apple is in for a rough ride, will you? You
blast Atari "worshippers" for their blind faith in Atari and you
do exactly the same for Apple. Hypocrite.

The new CEO will be slashing and streamlining right and left, just
as he did at National Semiconductor. Expect more Apple layoffs.
Expect huge cuts in their R&D and product lines. The new CEO
will slash anything and everything that is not profitable. The
next 1-2 years will be really tough for Apple and I'd bet that their
marketshare will shrivel to 5% by the time it's all over. Whether
or not a turnaround will happen after this is another question.

>You think? Lets see, the Vice Prez, Hillary and the Prez(will be in Iowa City
>this week) don't think so because all three have been here in the last three
>weeks..

It's the Iowa caucuses, dumbass. They are of great political significance
for they really mark the beginnings of the primaries. That doesn't
mean your "lake of the woods" has great economic significance in
the computer market.

>What are you talking about? Apple cleared $425 million in earnings after tax
>in 1995.

A miniscule amount. Apple is expecting even bigger losses for 1Q 1996
and their debt rating has been lowered, which now makes it more
difficult for Apple to borrow money.

/Kevin

Not to defend the problems with Windows, but this sounds exactly like the kind of nonsense that anti-PC, anti-Microsoft cronies would make up. Microsoft is so profitable that they do whatever they want and don't need to accept "kickbacks." How many RAM and HD manufacturers are there? How could they possibly organize in such a manner? Just the negotiations for such operations would be an incredible undertaking, not to mention of questionable legality.

Despite what I have just said, I have to agree with this point.

> But then of course, we dont need to replace our computers every eighteen
> months. A nine year old 1040ST will still do most things anyone wants -
> but a nine year old PC-AT will not.

I disagree. What won't a 9 yeear-old PC do? Will it not do for programming, communications, word processing, read CD-ROMs? So it won't play the latest games.... I'm not saying that a 1040ST won't work , either.

Oh, come on. Nobody is "brainwashed." This is a free country and you can buy any kind of computer, automobile, or hamburger you want - of your own free will.

Ha ha. Cute, but SISC has nothing to do with Apple, Powerbook 5300's, or
Lithium-ion batteries.

True.. But how many of those 225 million are in actual use. About 10 million
PC's are retired each year. I suspect about 50% of Apple's installed base is
in actual use..

Many of the PC's are used as dumb terminals and or for single tasks in
Corporations. On average, mac users buy more software on average..

> in the mid-late 80's blew away Apple's pricing.

$3900 is not the corect starting price..$2499 was the base price. I agree,
Apple's pricing was out of line, but Apple sales were higher. I was an Amiga
owner back than, but you knew what happened to C= and Atari. Reasons for
Apple's higher price: Marketing and R&D..You know what happened. Apple

advanced the line while C= and Atari did not.. You get what you paid for..

Plus Apple covered themselves by selling the $2499 Mac for $900 to Students and faculty at schools..

Apple is in a rough ride to change the business model.. the issue is that sales are still high. There are differences between Atari and Apple. Apple's products sell and are supported while hardly anyone wants the Jag and is poorly supported.

> The new CEO will be slashing and streamlining right and left, just

>
The $10 million a year CEO will slash the bloat that is severly needed. Even if Apple's share is down to 5%. Companies would kill if that share translates into $20 billion a year.. I doubt it. Overall, Apple's share will stabalize and with the acceptance of Power Computing as a alternative standard, nothing changes..

Having just aquired a 7 year old PC for nothing, I can probably understand what Gaven means.

The 7 year old PC is so poor when compared to my STFM (it has no colour,lousy sound, no GUI, slow hard drive & can't run most modern PC software) that, if it was all I had, I would look forward to changing it ASAP.

Of course, you can add upgrades -> spend spend spend.

I expect that it will still do all of the things that James says, It's just that I believe that the ST range has weathered better.

I've had an STFM since '88 & I was amazed that a machine manufactured a few years later was such a poor performer.

I've gotten real value for my money with the ST.

3740. ATARI up for sale? Why not buy it?

Newsgroup: comp.sys.atari.advocacy
Date: 1996-02-14 00:00:00 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <4ftsc9$8f3@madeline.INS.CWRU.Edu>
Source record: 10295
Cross-posted to: rec.games.video.atari,rec.games.video.misc,misc.invest.stocks,comp.sys.atari.st,comp.sys.atari.advocacy

I know this may sound like a crazy idea, but why not buy Atari from JTS?
There must be thousands of Atari supporters out there.

If a large number of individuals purchased newly issued stock of a company
that would purchase the Atari name, logo, inventory, game rights, patents,
etc. and let JTS keep the company's capital and debt, I think that it could
be done.

Rumor is that the officers of JTS could care less about Atari and its video
game products.
Post to this thread if you think it might be able to be done.

: Post to this thread if you think it might be able to be done.

It's a nice idea, but who honestly has the cash to purchace
Atari? Certainly not individuals ... even rich ones. With all their
patents, liscences, technology, brand name, logo and everything, the cost
of buying Atari would probably be over $100 million.

: Drop in the bucket? He he he he. What makes Jag sales than?

You always like to drag that in, don't you? For that matter, what
are any NG console sales compared to PCs?

: True.. But how many of those 225 million are in actual use. About 10 million
: PC's are retired each year. I suspect about 50% of Apple's installed base is
: in actual use..

Yeah ... right. All those MAC512s and MAC LC's are sure getting
lotsa use these days I bet. My uncle bought a Mac a couple of years ago
for several grand only to find that it's totally useless now.

: Many of the PC's are used as dumb terminals and or for single tasks in
: Corporations. On average, mac users buy more software on average..

That's because they know extended pirating would kill them off
for good.

: $3900 is not the corect starting price..$2499 was the base price.

Still a joke. I remember going into a Computer store and seeing a
Mac512 for $2000 and an Atari 520ST for $500. The ST kicked the shit out
of the Mac in almost every area technically, yet Apple still charged four
times as much. It had better support, but still ... that was out of line!

: A miniscule amount..Only Atari can dream of..

Atari doesn't need to dream about it considering they aren't
saddled with all the expenses Apple is.

"Let's Buy Atari"- Only from Atari users would you ever hear such a thing.

Even though you couldn't do much worse.

>how many computer companies dare to go against the grain in America today
>and try to fight Micro$oft?

Except that... MicroSoft is NOT a computer company.

MicroSoft writes software that runs ON computers.

MicroSoft wrote the BASIC interpreter that ran on my first computer, an
Ohio Scientific Instruments C1P.

MicroSoft also wrote the MS BASIC interpreter that ran on the Atari 800.

MicroSoft would write programs for the Atari Jaguar, if they thought it would
be profitable.

The most commonly used, and thus most profitable, computer platform now in use
is the Intel architecture IBM PC clone... so of course MicroSoft writes
software for it.

If another platform supplants the "PC", I'd expect MicroSoft would write
programs for it too...

As for computer manufacturers, Atari Corp had an excellent opportunity to
become one of the top manufacturers of computer systems when the ST was
released. MicroSoft had announced Atari ST versions of many of their most
popular programs.

Atari management simply blew it.

I'm thinking 10-20 million since the patents are almost out anyways.

Me, I'm buying shares in C-Lab among others. Why? I wouldn't touch
anything that still has the Tramiels involved.

Originally Time Warner Inc. lent Jack Tramiel millions to buy Atari from
them, now 'JT and Son' are lending JTS money to buy Atari from them. Guess
what they say is true ... "What goes around, comes around"

A couple of years ago (1989?), Atari's sale value was listed at a half
billion dollars. Even though the company has signifigantly downsized over
the years, you still wouldn't get Atari for less than 100 million. Too
many patents, schematics, copyrights, inventories, plans, liscences etc,
etc, etc.

Rumor has it (FWIW) that Ted Hoff tried that (unsuccessfully). Don't know if it's true or not. If true, it doesn't sound like the Tramiels are ready to give up the Fuji....

I don't know about the Mac512s(nice for a fish aquarium), the LC's are still in use. Even my dept. has quite a few in use..Slowly being replaced with 7200's.. Many schools are still using the Apple II..

He he he he..Technicaly in hardware at the time, but not in the system software...

Apple didn't think their pricing was out of line at the time because of their huge investment in R&D. Looks at their system products as a result...Just because Atari did not have faith in their products is not Apple's fault. Apple charged what the market would absorb..No that I agreed at the time..

After reading the Atari newsgroups for years, I can picture what the
board meetings would be like. Of course, you could hire Sinclair and
then all line up and fire him ;)

Although it would be a nice idea to buy atari I think that a new company to take up where atari left off with the TOS computers would be much easier to come by, the patents being the only things that need to be adhered to (or bought off) from atari in order for this to happen...

However, i think it much more likely that the third party support will be the way the platform will go, look at the new machines, for example, Hades, T40, T60, eagle, falcon mark x......

It is a shame about Laser C - I've still got an old version of it somewhere.
It dumped on Lattice from a great height....shame it didn't keep going.
